# **ACCOUNTING AND FINANCE**

## **Stage 3**

### **WACE Examination 2010**

### **Specifications Booklet**

## Calculation for depreciation

### Straight-line method

$$\frac{\text{Original cost} - \text{Residual value}}{\text{Useful life}}$$

or

$$\frac{\text{Depreciable amount}}{\text{Useful life}}$$

### Reducing/Diminishing balance method

Carrying amount = Original cost – Accumulated depreciation

Annual depreciation expense = Carrying amount x depreciation rate

## Preparation of ratios

| Ratio                        | Method of calculation   |
|------------------------------|---|
| Profit                       | $\frac{\text{Profit (after income tax)}^A}{\text{Total revenue}}$   |
| Debtors collection           | $\frac{\text{Average debtors}}{\text{Net credit sales}} \times \frac{365}{1}$   |
| Inventory/stock turnover     | $\frac{\text{Cost of sales}}{\text{Average cost of inventory}}$   |
| Debt to equity               | $\frac{\text{Total liabilities}}{\text{Equity (end)}}$  |
| Working capital/current      | $\frac{\text{Current assets}}{\text{Current liabilities}}$  |
| Quick asset/liquidity        | $\frac{\text{Current assets (excluding inventory and prepayments)}}{\text{Current liabilities (excluding bank overdraft)}}$ |
| Rate of return on assets     | $\frac{\text{Profit before income tax + interest expense}}{\text{Average total assets}}$                                    |
| Times interest earned*       | $\frac{\text{Profit before income tax + interest expense}}{\text{Interest costs (expensed and capitalised)}}$               |
| Earnings per ordinary share* | $\frac{\text{Profit (after income tax) - preference dividends}}{\text{Weighted average number of ordinary shares issued}}$  |
| Price/earnings*              | $\frac{\text{Market price per ordinary shares}}{\text{Earnings per ordinary share}}$  |
| Dividend yield*              | $\frac{\text{Annual dividend per ordinary share}}{\text{Market price per ordinary share}}$                                  |

\* [From: Hoggett, J., Edwards, L., & Medlin, J. (2006). *Accounting* (6th ed.). Brisbane: John Wiley, p. 1079  
 © John Wiley & Sons Australia. Reprinted with permission]

A = at the prevailing company rate (e.g. 30%)

Results from calculations may be presented either as a percentage or as a ratio.

## **Cost volume profit analysis for profit planning**

### **Basic cost profit concepts**

Total costs = Total variable costs + Total fixed costs

$$\text{Unit cost} = \frac{\text{Total cost}}{\text{Number of units}}$$

Net profit = Total revenue – Total costs

Break-even is where profit = zero; therefore Total revenue = Total costs

### **Calculation of contribution margin**

Contribution margin per unit = Selling price per unit – Variable costs per unit

or

Total contribution margin = Total revenue – Total variable costs

or

$$\text{Contribution margin ratio} = \frac{\text{Contribution margin}}{\text{Revenue}}$$

### **Break-even point for a single product firm**

$$\text{Break-even point in units} = \frac{\text{Total fixed costs (TFC)}}{\text{Contribution margin}}$$

or

$$\text{Break-even point (in sales dollars)} = \frac{\text{Total fixed costs (TFC)}}{\text{Contribution margin ratio}}$$

### **Break-even point in total units in multi-product firm**

$$\text{Break-even point in units} = \frac{\text{Total fixed costs (TFC)}}{\text{Weighted average contribution margin per unit}}$$

### **Forecast revenue for target net profit**

Forecast revenue (in sales dollars) = Total variable costs + Total fixed costs + Target net profit

$$\text{Forecast target revenue (in units)} = \frac{\text{Total fixed costs (TFC)} + \text{Target net profit}}{\text{Contribution margin per unit}}$$

## Standard cost accounting and variance analysis

Standard cost per unit = Standard input quantity allowed per output unit x Standard price per input unit

### Direct material variance

#### Price Variance

Price variance =  $(\text{Actual Price of input} - \text{Standard Price of input}) \times \text{Actual Quantity of input Purchased}$   
 [i.e.  $(AP - SP) \times AQP$ ]

or

$(\text{Actual Price per input unit} \times \text{Actual Quantity Purchased}) - (\text{Standard Price per input unit} \times \text{Actual Quantity Purchased})$   
 [i.e.  $((AP) \times (AQP)) - ((SP) \times (AQP))$ ]

#### Usage Variance

Usage variance =  $(\text{Actual Quantity of input Issued} - \text{Standard Quantity of input Allowed for actual output}) \times \text{Standard Price of input}$   
 [i.e.  $(AQI - SQA) \times SP$ ]

or

$(\text{Standard Price of input} \times \text{Standard Quantity of input Allowed for actual output}) - (\text{Standard Price of input} \times \text{Actual Quantity of input Issued})$   
 [i.e.  $((SP) \times (SQA)) - ((SP) \times (AQI))$ ]

### Direct labour variances

#### Rate Variance

Rate variance =  $(\text{Actual Rate per Direct Labour Hour worked} - \text{Standard Rate per Direct Labour Hour worked}) \times \text{Actual Direct Labour Hours worked}$   
 [i.e.  $(AR - SR) \times ADLH$ ]

or

$(\text{Actual Rate per Direct Labour Hour worked} \times \text{Actual Direct Labour Hours worked}) - (\text{Standard Rate per Direct Labour Hour worked} \times \text{Actual Direct Labour Hours worked})$   
 [i.e.  $((AR) \times (ADLH)) - ((SR) \times (ADLH))$ ]

#### Efficiency Variance

Efficiency variance =  $(\text{Actual Direct Labour Hours worked} - \text{Standard Direct Labour Hours Allowed for actual output}) \times \text{Standard Rate per Direct Labour Hour}$   
 [i.e.  $(ADLH - SDLHA) \times SP$ ]

or

$(\text{Standard Rate per Direct Labour Hour} \times \text{Standard Direct Labour Hours Allowed for actual output}) - (\text{Standard Rate per Direct Labour Hour} \times \text{Actual Direct Labour Hours worked})$   
 [i.e.  $((SR) \times (SDLHA)) - (SR) \times (ADLH)$ ]

## Fixed manufacturing overhead variances

### Fixed manufacturing overhead spending variance

Fixed manufacturing overhead spending variance = **Actual Fixed Manufacturing Overhead – Budgeted Fixed Manufacturing Overhead**  
[i.e. AFMOH – BFMOH]

### Fixed manufacturing overhead capacity variance

Fixed manufacturing overhead capacity variance = **Budgeted Fixed Manufacturing Overhead – (Standard Fixed Manufacturing Overhead Rate per activity unit x Standard Activity Allowed for actual output)**  
[i.e. BFMOH – (SFMOHR) x (SAA)]

## Variable manufacturing overhead variances

### Variable manufacturing overhead spending variance

Variable manufacturing overhead spending variance = **Actual Variable Manufacturing Overhead – Flexible Budget Allowance for Variable Manufacturing Overhead**  
Where Flexible Budget Allowance for Variable Manufacturing Overhead= **(Standard Variable Manufacturing Overhead Rate per activity unit x actual activity)**  
[i.e. SVMOHR x actual activity]

### Variable manufacturing overhead efficiency variance

Variable manufacturing overhead efficiency variance = **Flexible Budget Allowance for Variable Manufacturing Overhead – (Standard Variable Manufacturing Overhead Rate per activity unit x Standard Activity Allowed for actual output)**  
[i.e. FBAVMOH – (SVMOHR) x (SAA)]

## Capital budgeting

### Net present value (NPV) method (time value of money)

Table A.4: Present value of an ordinary annuity of \$1 at the end of future periods

| Periods | 2%      | 3%      | 4%      | 5%      | 6%      | 8%      | 10%    | 12%    | 16%    | 20%    |

## **Capital budgeting**

### **Net present value (NPV)**

NPV = Present Value of Future Net cash Flows – Present Value of Cost of Project

### **Payback period**

The payback period calculates the period of time needed for any investment to pay for itself. This method does not use the time value of money.

The formula, where annual net cash flows are constant, is:

$$\text{Payback period} = \frac{\text{Initial cost of investment}}{\text{Annual net cash flows}}$$

### **Return on average investment method/Accounting rate of return**

The average investment is calculated as:

$$\text{Average investment} = \frac{\text{Initial investment} + \text{Residual value}}{2}$$

Return on average investment is calculated as:

$$\text{Return on average investment} = \frac{\text{Average net profit}}{\text{Average investment}}$$
