1. Attribution

You must give appropriate credit for these exam notes and provide a link to our website (www.sharpened.com.au) whenever you refer to these exam notes.

2. Non-Commercial

You are strictly not allowed to use these exam notes for any commercial purposes under any circumstances.

3. No Derivatives

If you change, edit or alter the original state of these exam notes, you are not allowed to distribute or shared the modified material under any circumstances.

About the Creator - Anthony Bochrinis

Hello! My name is Anthony and I graduated from high school in 2012, completed a Bachelor of Actuarial Science in 2015, completed my Graduate Diploma in Secondary Education in 2017 and am now a secondary mathematics teacher!

My original exam notes (created in 2013) were inspired by Severus Snape's copy of Advanced Potion Making in Harry Potter and the Half-Blood Prince; a textbook filled with annotations containing all of the pro tips and secrets to help gain a clearer understanding.

Thank you for being a part of my journey in realising that teaching is my lifelong vocation!

Keep Up to Date with Sharpened[®]

To be kept in the loop with all the latest resource releases, seminar dates, updates, news and tips, be sure to follow us on our social media and bookmark our website!

How to Use these Exam Notes

These exam notes are designed to be a complement to your studies throughout the year. As such, I recommend using these exam notes during class, during tests, whilst studying at home or in the library and even in the calculator-assumed section of your mock and WACE exams.

These exam notes are entirely yours, and under our licensing information, you are free to edit or modify these notes according to your liking, so long as they are not distributed!

The layout of these notes follows a simple system under our new design format:

- Exam Notes Layout: there are four pages each laid out in four columns.
- Major Topics: are coloured in black and act as a divider for the content that follows.
- Minor Topics: are smaller topics that are written at the top of each coloured box.
- Minor Topic Subheadings: within each minor topic are subheadings that are headed with a coloured square. This acts as a further segmentation of the exam notes which makes finding specific content that you are looking for much more straightforward.

 \star NOTE: When you print these exam notes, please print pages 5 – 8 double sided \star

FAQ – Frequently Asked Questions

FAQ #1: Are these exam notes even relevant according to the SCSA syllabus?

Our ATAR mathematics exam notes/cheat sheets are designed to be used by Western Australian year 12 students in preparation for their mock and WACE exams. As such, all of the content found in our exam notes are based on the official School Curriculum and Standards Authority (SCSA) syllabus.

FAQ #2: Am I allowed to use these exam notes in my Mock and WACE Exams?

In short, yes! Our exam notes are best used in the calculator assumed section of your mock and WACE exams. However, if you're worried that our exam notes will be confiscated in your exams or if you think it'll look weird if all of your classmates have the same notes, don't worry!

In 2016, we had over 8,000 WA year 12 students take our notes into their WACE exam. This didn't go unnoticed! As a result, the School Curriculum and Standards Authority (SCSA) have added a rule as of the 2017 Year 12 Handbook that allows any commercial notes to be used in WACE exams!

FAQ – Frequently Asked Questions Continued

FAQ #3: Do these exam notes get updated at all?

Yes! We constantly receive advice for changes by teachers from high schools all across Western Australia! We use this expert knowledge to provide you with the most up to date set of exam notes possible! As such, please check back on our website before you sit any tests or exams as there may be an update that helps you earn you a few extra marks!

FAQ #4: Why are these exam notes free?

After realising that teaching is my life's goal, I want to spread the gift of mathematics and its underlying principles all around WA (and someday maybe even the world). To make it equally fair and accessible to everyone, I decided to make these notes free for everyone. If you like my notes and would like to support me, I would appreciate looking at the other paid services that Sharpened[®] has to offer.

Exam Notes Disclaimer

Although material from the School Curriculum and Standards Authority is included as part of this Course Handbook, it does not constitute endorsement of this publication.

All effort is made to ensure that the information contained in these exam notes are correct and accurate but does not provide a guarantee to the authenticity of this content. By using these exam notes, you agree to the terms and conditions listed on the Sharpened[®] website.

These exam notes are designed to augment study and may not reflect what may be covered in class or school based examinations or assessments.

For any questions relating to any matter, please contact us at:

- Website: www.sharpened.com.au
- E-Mail Address: anthony@sharpened.com.au

A final word ...

Thank you for downloading my exam notes and I really hope they help to sharpen your knowledge. Please take comfort in the fact that Sharpened[®] is here to support you outside of the classroom! You can do this and I wish you all the very best!

Now comes the fun part ...

Without any further ado, I present to you my exam notes!

Yours Sincerely, Anthony Bochrinis

BIVARIATE DATA

TYPES OF VARIABLES

- Response and Explanatory Variables
- Response Variable (RV) Also known as the dependent variable.
- Plotted on the vertical axis (y axis).
- Explanatory Variable (EV)
- Also known as the independent variable. Plotted on the horizontal axis (x - axis).

The Response Variable (RV) depends

on the Explanatory Variable (EV) Examples of RV's with Matching EV's

- The RV, weight loss (kg), depends on
- the EV, time spent dieting (days). The RV, wage (dollars), depends on
- the EV, time spent working (hours).
- The RV, heart rate (bpm), depends on the EV, caffeine consumption (mg)

CORRELATION COEFFICIENT

Pearson's Correlation Coefficient (r) Measures the direction and strength of a linear relationship between a RV and an EV.

Measured by "r" where $-1 \le r \le 1$

- Coefficient of Determination (r²)
- Calculated by <u>squaring</u> Pearson's correlation coefficient (*i.e.* $r^2 = r \times r$)

Measured by " $r^2 imes 100\%$ " where $0 \le r^2 \le 1$

- r^2 measures the percentage variation in the RV with the variation in the EV.
- For example, if $r^2 = 0.85$, then "85% of the variation in the RV can be explained by the variation in the EV"
- As r² increases, the regression line becomes a more appropriate model for the data.

SCATTERPLOTS

Describing a Scatterplot

- Form: pattern type (i.e. linear or non-linear).
- Direction: where the points tend towards Positive: from bottom-left to top-right Negative: from top-left to bottom-right

Strength: how closely the points follow

a linear pattern (e.g. perfect, strong, etc.).

Value of r	Strength	Direction
<i>r</i> = 1	Perfect	Positive
$0.75 \le r < 1$	Strong	Positive
$0.5 \le r < 0.75$	Moderate	Positive
$0.25 \le r < 0.5$	Weak	Positive
$-0.25 \le r < 0.25$	None	None
$-0.5 \le r < -0.25$	Weak	Negative
$-0.75 \le r < -0.5$	Moderate	Negative
-1 < r < -0.75	Strong	Negative
	Destant	Negative
r = -1	Perfect	negative
r = -1 Examples of RV/E		
	V Associa	

LINE OF BEST FIT Line of Best Fit (ŷ) · A linear equation that best represents the relationship between a RV and EV (also known as the least-squares regression line) Shown by " \hat{y} " where $\hat{y} = ax + b$ a: gradient (i.e. steepness of the line). explanatory variable. b: v-intercept (i.e. where the line of best fit intercepts/crosses the y-axis). Interpreting Gradient of Line of Best Fit The EV increases by a for a > 0each increase in a single RV The EV decreases by a for

each increase in a single RV For example, if a = 0.95, EV is amount of rainfall (mm) and RV is temperature (°C): Therefore, the amount of rainfall

increases by 0.95 mm for each increase in the temperature by 1 °C.

CORRELATION VS. CAUSATION

Correlation Does Not Imply Causation

Regardless if there is a strong correlation coefficient between two variables, it does not provide sufficient evidence to prove that the two variables are causally related (i.e. that the EV actually causes the RV in reality). There are two reasons for this phenomenon

Coincidence Confounding Caused by pure chance during data Caused by a third variable not being collection. considered.

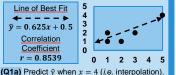

To reduce the chance of these errors occurring, increase the data sample size.

- Coincidence & Confounding Examples $\underline{Coincidence}:$ by pure chance, the collection of data comparing human height (m) and human arm length (m) may "accidently
- show a strong negative correlation, where in reality this would certainly not the case. Confounding: although amount of sunscreen applied (mL) and fainting (# of cases) may
- have a strong positive linear association, this likely due to a third variable, temperature (°C), not being considered.

PREDICTING DATA

- Interpolation (i.e. Predicting Inner Data)
- Using the line of best fit to predict values that lie within the range of the original data
- Safe to use, only if the association between the RV and EV is strong.
- Extrapolation (i.e. Predicting Outer Data)
- Using the line of best fit to predict values that lie outside the range of the original data.
- Increasingly dangerous to predict data the further it is outside the current data. This is because the future is still unclear (regardless of how strong the correlation coefficient is).

Interpolation & Extrapolation Examples

 $\theta = 0.625x + 0.5 = 0.625(4) + 0.5 = 3$ (Q1b) Predict \hat{y} when x = 8 (*i.e.* extrapolation).

= 0.625x + 0.5 = 0.625(8) + 0.5 = 5.5Dangerous to use as x = 8 lies well outside the original data set (regardless of the strong, positive linear relationship).

RESIDUALS

- Residuals (e)
- The vertical distance between a data point and the line of best fit.
- Residuals can have two types of values: Positive value if above the line of best fit. Negative value if below the line of best fit.
- Measured by "e " where e =
- or e = actual data predicted data
- e: residual (positive or negative). y: actual value (the value of y in the
- co-ordinate from the original data set). \hat{y} : predicted value (substitute x into the

2

0 -1

-2

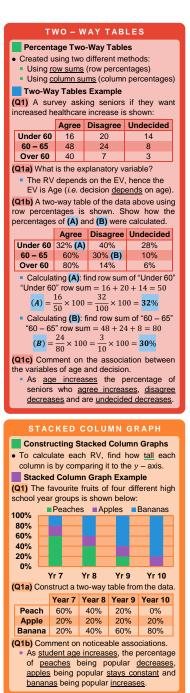

.

Residual Plot

Random pattern.

Therefore, a linear

model is a good fit.

TIME SERIES

DESCRIBING TIME SERIES Graphing Time Series Displays time (x - axis) such as annual. monthly, weekly or daily and another variable (y - axis) such as cost, sales or rainfall. Types of Time Series Trends Positive Negative Downward Trend Upward Trend Types of Time Series Patterns Seasonal Pattern **Cyclical Pattern** Peaks and troughs Peaks and troughs with different with similar sizes at regular intervals at irregular intervals Time Series Example (Q1) Plot the following time series and find an appropriate seasonal pattern in the data

Year 1 2 3 4 5 6 7 8 9 10 Cost 4 7 6 3 6 5 2 5 4 1 Finding a Pattern A seasonal pattern occurs after every 3 years (periods)

$3PMA = (a+b+c) \div 3$ 3PMA: 3 point moving average. - c: 3 successive data points associated with the 3PMA that you are looking for. Calculating 3PMA Example Period Value 3PMA Period Value 3PMA 15 6 22 19.67 17 <mark>(A)</mark> 19 20 20.33 3 20 17.67 8 19 23 (B) 21 a 17 18.33 19 10 21 5 18 -- •- - 3PMA Value 23 21 • -----19 17 15 2 3 4 5 6 7 9 10 (Q1a) Calculate the value of the 3PMA (A): Use 3 values that has (A) vertically halfway: $(A) = 3PMA_{t=2} = \frac{15 + 16 + 20}{2}$ = 17 (Q1b) Calculate the value of (B): Use a group of 3 numbers that includes (B): $\frac{19 + (B) + 23}{2} = 20.33 \quad (B) + 42 = 61$ (B) = 1919 + (B) + 23 = 61EVEN MOVING AVERAGES Moving Averages for Even Patterns $4PMA = (a+b+c+d) \div 4$ 4PMA: 4 point moving average. a - d: 4 successive data points associated with the 4PMA that you are looking for. Calculating 4PCMA Example Period Value 4PMA 4PCMA 20 15 -23 (A) 2.5 20.75 22 20.5 3.5 20.25 18 20 19.75 (B) 4.5 18 19.5 19.25 5.5 19 21 18.75 6.5 20 18.75 7.5 18.75 8 16 18.375 (C) 18 8.5 9 18 9.5 10 18 Value -- e-- 4PCMA 23 21 - 0-19 -. 17 15 2 3 4 5 6 7 8 9 10 (Q1a) Calculate the value of (A) Use <u>a</u> group of <u>4</u> numbers that includes (A): $\frac{20 + (A) + 22 + 18}{20 + (A) + 22 + 18} = 20.75 \quad (A) + 60 = 83$ (*A*) = 23 20 + (A) + 22 + 18 = 83(Q1b) Calculate the value of the 4PMA (B) Use 4 values that has (B) vertically halfway: $(B) = 4PMA_{t=4.5} = \frac{22 + 18 + 18 + 21}{4} = 19.75$ (Q1c) Calculate the value of the 4PCMA (C): Average the 2 closest 4PMA values to (C): $(C) = 4PCMA_{t=8} = \frac{18.375 + 18}{2} = 18.375$ Calculating 4PCMA Shortcut Formula

ODD MOVING AVERAGES

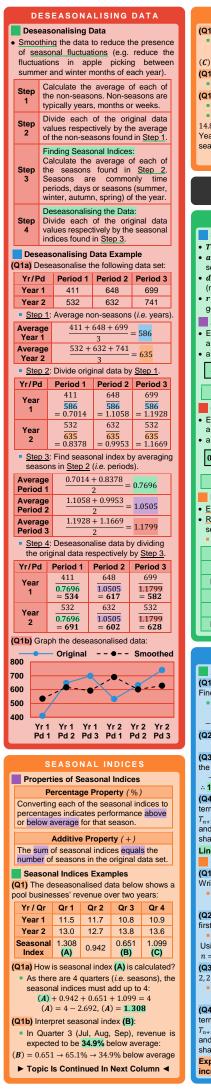

Moving Averages for Odd Patterns

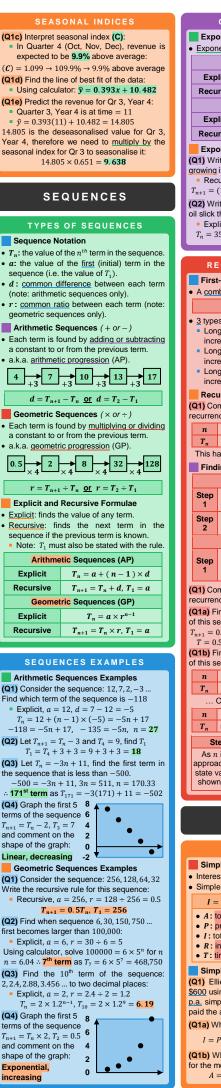

- $4PCMA = (0.5a + b + c + d + 0.5e) \div 4$ 4PCMA: 4 point centered moving average a - e: 5 successive data points associated with the 4PCMA that you are looking for.
- (Q1d) Use this formula to find the 4PCMA (C): As this is a 4PCMA, find the 5 numbers in the value column that has (C) vertically halfway: $(C) = \frac{0.5 \times 18 + 21 + 20 + 16 + 18 + 0.5 \times 18}{2}$
 - 9 + 21 + 20 + 16 + 18 + 9 = 18.754

• Use 1st formula: $Final = r + T_{FN}$ $Final = r + T_{26} = 500 - 176.6716 = 323.33

• Or use 2nd formula: $Final = T_{LP} \times \left(1 + \frac{i}{n}\right)$

Final = $T_{25} \times \left(1 + \frac{0.025}{12}\right) =$ \$323.33

 $Total Cost = (n \times r) + Final$ $Total Cost = (25 \times 500) + 323.33$

= \$12823.33

(Q1d) Calculate the total cost of the car.

Compound Interest and Effective Rates (Q1) \$50,000 is invested into a bank with a rate of 7.67% p.a., compounding half-yearly over 3 years. How much interest does it accrue? 0.07(7.2×3

$$A = 50000 \left(1 + \frac{0.0767}{2}\right) = \$62666.09$$
$$I = A - P = 62666.09 - 50000 = \$12666.09$$

(Q2) \$30,000 can be invested into a bank using two different saving schemes:

X: 6.22% p.a. compounding monthly

• Y: 6.25% p.a. compounding guarterly Find the effective rate of interest for both

schemes, which would pay more after 3 years? 0.0622

$$X = \left(1 + \frac{1}{12}\right)^4 - 1 = 0.0640 = 6.49$$
$$Y = \left(1 + \frac{0.0625}{4}\right)^4 - 1 = 0.06398 = 6.398$$

.. Scheme X pays more interest than Y (Q3) Lucy wants to set up a perpetuity of \$5,000 per year at a bank that pays 6% p.a. compounding monthly. Determine how much

is required to maintain this perpetuity. • For a perpetuity, $Q = P \times E$ $Q = 5000, E = \left(1 + \frac{0.06}{12}\right)^{12} - 1 = 0.06168$

 $Q = P \times E$, 5000 = $P \times 0.06168$ $P = 5000 \div 0.06168, P =$ **\$81,066.43**

COMPOUND INTEREST TABLES

Compound Interest Table Form (Q1) Sophia borrows \$500 at 6% p.a. compounding guarterly and makes quarterly

P	ayments of $\frac{150}{9150}$ to pay	on the loan.
•	Financial product type:	loan

•	Regular payment: payment	(negative value)
	Ouarterly $1\%: i \pm n = 6 \pm 4$	- 1 5% - 0 015

Quarter	1	2	3
Start Amount	\$500	\$357.50	\$212.86
Interest	+ \$7.50	+ \$5.36	+ \$3.19
Payment	- \$150	- \$150	- \$150
End Amount	\$357.50	\$212.86	\$66.05

(Q2) Lucas invests \$600 into an account that pays <u>4% p.a.</u> compounding <u>monthly</u> and makes monthly deposits of <u>\$50</u>.

Financial product type: investment

Regular payment: deposit (positive value)

• Working 1% : $l \div n = 4 \div 12 = 0.3\% = 0.003$				
	Month	1	2	3
	Start Amount	\$600	\$652	\$704.17
	Interest	+ \$2	+ \$2.17	+ \$2.35
	Deposit	+ \$50	+ \$50	+ \$50
	End Amount	\$652	\$704.17	\$756.52

(Q3) Charlotte invests \$1,000 into an annuity that pays \$250 every six months at 8% p.a. compounding half-yearly.

Financial product type: annuity

Regular payment: withdraw (positive value)

• Hall-yearly 1%: $l \div n = 8 \div 2 = 4\% = 0.04$				
Month	1	2	3	
Start Amount	\$1,000	\$790	\$571.60	
Interest	+ \$40	+\$31.60	+\$22.86	
Withdraw	- \$250	- \$250	- \$250	
End Amount	\$790	\$571.60	\$344.46	

RECURSIVE RELATIONS

Compound Interest Recursive Rules (Q1) Oliver has borrowed \$8,750 to buy a car and is making repayments of \$750 at the end each month on the loan, with interest of charged monthly. The interest for the first month totaled to \$65.50.

(Q1a) Calculate the annual interest rate.

- $= i \pm P$, $r = 65.5 \pm 8750$, r = 0.007486
- Monthly interest rate is 0.07486%
- Annual rate = $0.007486 \times 12 = 0.08983$ Annual interest rate is 8.98%

(Q1b) Express this loan as a recursive rule. $T_{n+1} = \left(1 + \frac{0.0898}{12}\right)T_n - 750, T_0 = 8750$

 $T_{n+1} = 1.007486T_n - 750, \ T_0 = 8750$

(Q1c) How much does he owe after 1 year?

1 year = 12 months, T₁₂ = \$932.26 (Q1d) How much interest in total is charged after the first year of the loan?

- Total paid off loan = $8750 T_{12}$
- = 8750 932.26 = \$7.817.74
- Total repayments = $750 \times 12 =$ \$9,000 To calculate interest, subtract the amount paid off loan from the total repayments = 9000 - 7817.74 = \$1, 182.26

Matrix that shows how many times each vertex is connected (adjacent) to another vertex by a single edge. From vertices on left, To vertices are above. Loops only count once in adjacency matrices. Adjacency Matrix (Undirected Graph) Matrix is <u>symmetrical</u> along the diagonal B Adjacency **To B** 1 0 *C* 1 Matrix 2 From B **c**l₁ 2 0 Adjacency Matrix (Directed Graph) Matrix is not symmetrical along the diagonal. To B C Adjacency A Matrix õ õ Aſ 0 From B 1 1 0 TRANSITION MATRICES Properties of a Transition Matrix Any entries in an adjacency matrix raised to the nth power indicates how many ways it is possible to move to and from the points corresponding to that entry in <u>n steps</u>. 1-Step = M $2-Step = M^2$ 1-Step or 2-Step = $M + M^2$ • M : adjacency matrix. M^2 : adjacency matrix squared. 1-Step : a matrix showing number of ways to travel between vertices in 1 step. 2-Step : a matrix showing number of ways to travel between vertices in 2 steps. 1 or 2-Step : a matrix showing number of ways to travel between vertices in 1 or 2 steps (i.e. combines 1-Step and 2-Step). Transition Matrix Example (Q1) A connected graph and related transition matrices M, M^2 and $M + M^2$ are shown below: М 2 **2** 1 0 1 1 0 00 0 0 0 0 1 1 С 0 0 0 $\begin{array}{c} \underline{M^2} \\ 2 & 1 \\ 2 & 1 \\ 3 & 0 \end{array}$ $\begin{array}{c} M = 1 \\ \overline{M + M^2} \\ 3 & 3 & 1 \\ 5 & 3 & 1 \\ 3 & 3 & 1 \end{array}$ 5 3 <mark>3</mark> 1 0 0 5 2 0 1 0 1 0 2 0 1 0 1 1 0 1 0 0 1 1 1 (Q1a) Explain how the highlighted entry "2" is calculated in transition matrix M. Matrix M shows 1-Step transitions. The highlighted entry shows that there are **2 ways** of going from **A to B in 1 step**. (Q1b) Explain how the highlighted entry "0" is calculated in transition matrix M² Matrix M² shows 2-Step transitions. The highlighted entry shows that it is **impossible** to go from **E to D in 2 steps**. (Q1c) Explain how the highlighted entry "3' is calculated in transition matrix $M + M^2$ $M + M^2$ shows 1- or 2-Step transitions The highlighted entry shows that there are 3 ways of going from C to A in 1 or 2 steps. WALKS, PATHS AND TRAILS Walks (Open and Closed) Walk: a sequence of vertices in a graph that represents a particular travel route. Open Walk: a type of walk that start and ends on two different vertices. Closed Walk: a type of walk that starts and ends on same vertex. Length of a Walk: number of edges of a walk. Paths and Trails (Open and Closed) Paths and trails are types of walks that do not

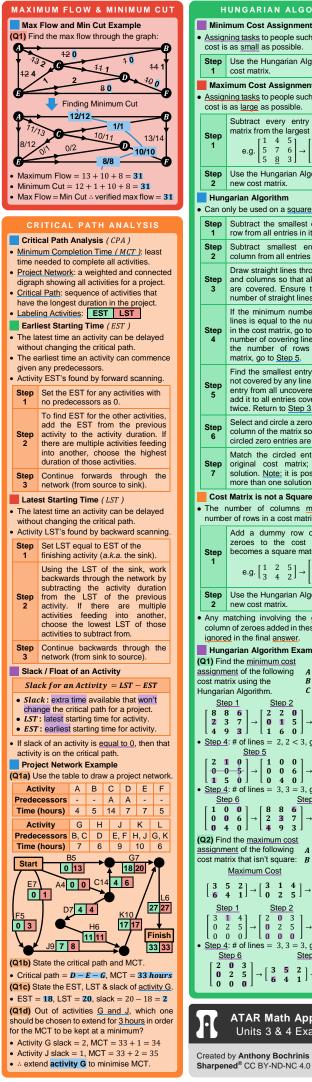

- have to use all vertices and edges in a graph. Edges Name Vertices Open Path Can't Repeat Can't Repeat Closed Path Can't Repeat* Can't Repeat (a.k.a. cycle) May Repeat Can't Repeat Open Trail Closed Trail May Repeat Can't Repeat (a.k.a. circuit) Exception to cycles*: only the starting and finishing vertex is allowed to repeat whilst all other vertices in the cycle cannot.

	H	UNGARIAN ALGORITHM
C	Mini	mum Cost Assignment
•		ning tasks to people such that the overall s as small as possible.
	Step	Use the Hungarian Algorithm on the
	1	cost matrix.
	_	imum Cost Assignment hing tasks to people such that the overall
Ī		as large as possible.
		Subtract every entry in the cost
	Step	matrix from the largest entry.
	1	e.g. $\begin{bmatrix} 1 & 4 & 5 \\ 5 & 7 & 6 \\ 5 & \underline{8} & 3 \end{bmatrix} \rightarrow \begin{bmatrix} 7 & 4 & 3 \\ 3 & 1 & 2 \\ 3 & 0 & 5 \end{bmatrix}$
	Step	Use the Hungarian Algorithm on this
	2	new cost matrix.
		garian Algorithm
•	Step	nly be used on a <u>square</u> cost matrix. Subtract the smallest entry in each
	1	row from all entries in its row.
	Step 2	Subtract smallest entry in each column from all entries in its column.
	2	Draw straight lines through the rows
	Step 3	and columns so that all zero entries are covered. Ensure that minimum
	3	number of straight lines are used.
		If the minimum number of covering lines is equal to the number of rows
	Step	in the cost matrix, go to Step 6. If the
	4	number of covering lines is less than the number of rows in the cost
		matrix, go to Step 5.
	Ston	Find the smallest entry in the matrix not covered by any line. Subtract this
	Step 5	entry from all uncovered entries and add it to all entries covered by a line
		twice. Return to <u>Step 3</u> .
	Step	Select and circle a zero entry in each column of the matrix so that no other
	6	circled zero entries are in its row.
	Step	Match the circled entries with the original cost matrix; this is the
	7	solution. <u>Note:</u> it is possible to have more than one solution.
ŀ	Cost	t Matrix is not a Square Matrix
•	The	number of columns must equal the
	numb	er of rows in a cost matrix.
		Add a dummy row or column of zeroes to the cost matrix so it
	Step 1	becomes a square matrix.
		$\mathbf{e.g.} \begin{bmatrix} 1 & 2 & 5 \\ 3 & 4 & 2 \end{bmatrix} \rightarrow \begin{bmatrix} 3 & 4 & 2 \\ 0 & 0 & 0 \end{bmatrix}$
	Step	Use the Hungarian Algorithm on this
	2	new cost matrix.
•		natching involving the <u>dummy</u> row or n of zeroes added in these steps is to be
	ignore	ed in the final answer.
		garian Algorithm Example ad the minimum cost D E F
<u>a</u>	ssignm	nent of the following A 8 8 6
