

# **CHEMISTRY**

## **WACE Sample Examination 2016**

### **Marking Key**

Marking keys are an explicit statement about what the examiner expects of candidates when they respond to a question. They are essential to fair assessment because their proper construction underpins reliability and validity.

## Section One: Multiple-choice

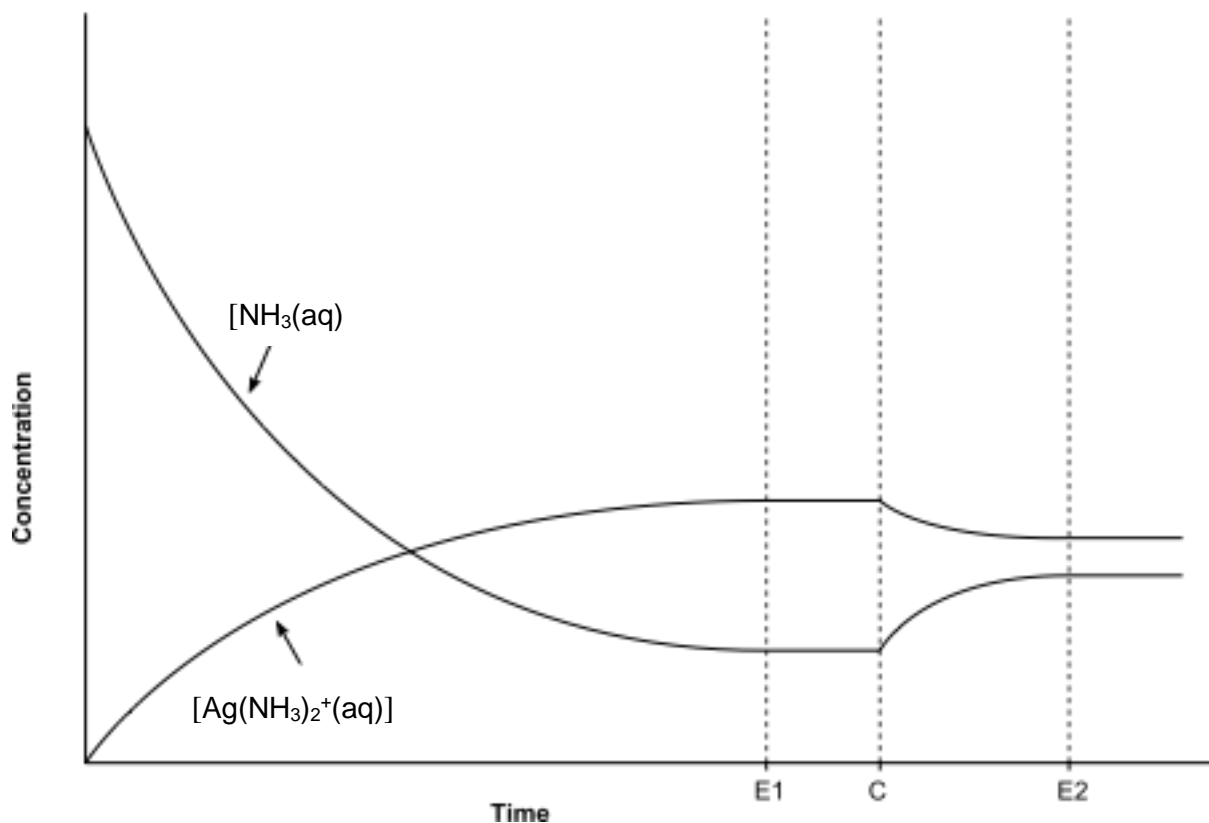

25% (25 Marks)

| Question No. | Answer |
|--------------|--------|
| 1            | B      |
| 2            | B      |
| 3            | C      |
| 4            | D      |
| 5            | C      |
| 6            | C      |
| 7            | A      |
| 8            | B      |
| 9            | B      |
| 10           | A      |
| 11           | B      |
| 12           | C      |
| 13           | A      |
| 14           | C      |
| 15           | C      |
| 16           | D      |
| 17           | C      |
| 18           | D      |
| 19           | D      |
| 20           | C      |
| 21           | C      |
| 22           | B      |
| 23           | A      |
| 24           | A      |
| 25           | C      |

## Question 26

(6 marks)

- (a) On the axes below, draw separate curves to show how the concentrations of  $\text{NH}_3(\text{aq})$  and  $[\text{Ag}(\text{NH}_3)_2]^+(\text{aq})$  change with time as the system approaches, and finally reaches, equilibrium (Time E1). Label clearly your curve for  $\text{NH}_3(\text{aq})$  and your curve for  $[\text{Ag}(\text{NH}_3)_2]^+(\text{aq})$ . Continue your curves from Time E1 to Time C. (3 marks)

| Description  | Marks    |
|--|----------|
| curves of correct shape for $\text{NH}_3(\text{aq})$ and $[\text{Ag}(\text{NH}_3)_2]^+(\text{aq})$   | 1        |
| straight line (concentration constant) at E1 to C  | 1        |
| correct final position of reactant and product concentrations relative to each other at E1 (i.e. conc. $\text{NH}_3 <$ conc. $[\text{Ag}(\text{NH}_3)_2]^+(\text{aq})$ ) | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>3</b> |
| Note: Change in concentration shown correctly (i.e., reactant decreasing and product increasing) but shown as straight lines rather than curves), award one mark.        |          |

- (b) At Time C, as shown on the axis, a small quantity of concentrated NaCl solution is added to the system, and the system is then again allowed to reach equilibrium at Time E2. On the same axes above, show how the concentrations of  $\text{NH}_3(\text{aq})$  and  $[\text{Ag}(\text{NH}_3)_2]^+(\text{aq})$  would change in response to the addition of NaCl solution from Time C until equilibrium is reached at Time E2. (3 marks)

| Description   | Marks    |
|---|----------|
| curves of correct shape for $\text{NH}_3(\text{aq})$ and $[\text{Ag}(\text{NH}_3)_2]^+(\text{aq})$                        | 1        |
| correct direction of concentration change for both $\text{NH}_3(\text{aq})$ and $[\text{Ag}(\text{NH}_3)_2]^+(\text{aq})$ | 1        |
| equilibrium reached at E2 and not before  | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>3</b> |

## Question 27

(10 marks)

- (a) Complete the table by writing the formula or drawing the structure for the conjugate base, species X or conjugate acid in each blank space as appropriate. Species X is the species that is able to form both a conjugate base and a conjugate acid. (6 marks)

| Conjugate base              | Species X                 | Conjugate acid                   |
|-----------------------------|---------------------------|----------------------------------|
| $\text{CH}_3\text{NH}^-$    | $\text{CH}_3\text{NH}_2$  | $\text{CH}_3\text{NH}_3^+$       |
| $\text{C}_2\text{O}_4^{2-}$ | $\text{HC}_2\text{O}_4^-$ | $\text{H}_2\text{C}_2\text{O}_4$ |
|                             |                           |                                  |

| Description                                    | Marks    |
|--|----------|
| 1 mark for each correct response in the table  | 1–6      |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>6</b> |

- (b) State whether the ratio of organic products to organic reactants will be equal to one, less than one ( $< 1$ ) or greater than one ( $> 1$ ) for this system at equilibrium at  $25^\circ\text{C}$ . (1 mark)

| Description  | Marks    |
|--|----------|
| ratio of P to R less than one $< 1$ ; OR there are less P than R | 1        |
| question incorrectly answered or not attempted                   | 0        |
| <b>Total</b>   | <b>1</b> |

- (c) Predict the direction in which the equilibrium will shift immediately after the changes indicated in the table below. Write 'left', 'right' or 'no change'. (3 marks)

| Change                     | Direction of initial equilibrium shift |
|----------------------------|--|
| decreasing the temperature | right                                  |
| adding hydrochloric acid   | left                                   |
| adding sodium hydroxide    | right                                  |

| Description                                    | Marks    |
|--|----------|
| 1 mark for each correct response in the table  | 1–3      |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>3</b> |

## Question 28

(6 marks)

- (a) Write the equation for the ionisation of acetylsalicylic acid in the space below, and identify the conjugate acid and base pairs in the reaction. Connect each acid-base pair with a line, and label the conjugate acid in the pair 'A', and the conjugate base 'B'. (3 marks)

| Description  | Marks    |
|--|----------|
| correct ionisation reaction $\text{RCOOH} + \text{H}_2\text{O} \rightleftharpoons \text{RCOO}^- + \text{H}_3\text{O}^+$<br>R does not need to be correct | 1        |
| 2 x connections of acid-base pairs   | 1        |
| 1 or both pairs correctly labelled   | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>3</b> |

- (b) Acetylsalicylic acid is a weak acid, and only partly ionises in water. It is poorly soluble in water, and far less soluble than a related compound, acetic acid ( $\text{CH}_3\text{COOH}$ ). Explain why the water solubility of molecular acetylsalicylic acid is less than that of  $\text{CH}_3\text{COOH}$ . (3 marks)

| Description   | Marks    |
|---|----------|
| recognition of predominance of dispersion forces between acetylsalicylic acid and water                             | 1        |
| recognition of predominance of H-bonding between acetic acid and water  | 1        |
| statement about solute-solvent interactions being sufficient to overcome solute-solute/solvent-solvent interactions | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>3</b> |

OR

| Description  | Marks    |
|--|----------|
| recognition of proportion of polar to non-polar  | 1        |
| for acetylsalicylic acid there is only limited interaction between solute-solvent particles.                                     | 1        |
| for acetic acid, as it is a predominantly polar molecule there will be significant interactions between solute-solvent particles | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>3</b> |

Note: Although the carboxylic acid functional group may form hydrogen bonds with water, the acetylsalicylic acid molecule is composed of large non-polar functional groups that are not water-soluble. These groups compose a significant proportion of the molecule. While acetic acid also contains non-polar groups, these groups make up a smaller proportion of the molecule

## Question 29

(4 marks)

Examine the two compounds below. Compound 1 is the naturally-occurring flavouring agent vanillin. Compound 2 is the local anaesthetic procaine. Name the functional groups circled in these two compounds.

Compound 1: Vanillin

Compound 2: Procaine

| Description                                      | Marks    |
|--|----------|
| 1 mark for each correctly named functional group | 1-4      |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>                                     | <b>4</b> |

## Question 30

(8 marks)

Write the phase, i.e. solid (s), liquid (l) or gas (g), of each species in this system at the temperatures shown in the table below, and predict the effect of an increase in total pressure on this equilibrium at each of the temperatures.

| Temperature (°C) | Phase (s, l or g)  |     |                    |                  | Shift in equilibrium (right, left or no change) |
|------------------|--------------------|-----|--------------------|------------------|---|
|                  | CH <sub>3</sub> OH | HCl | CH <sub>3</sub> Cl | H <sub>2</sub> O |   |
| -50              | l                  | g   | l                  | s                | right   |
| 40               | l                  | g   | g                  | l                | no change                                       |
| 70               | g                  | g   | g                  | l                | right   |
| 110              | g                  | g   | g                  | g                | no change                                       |

| Description   | Marks    |
|---|----------|
| 1 mark for correctly identifying phases at each temperature for each substance (all four at each temperature must be correct)                     | 1–4      |
| 1 mark for correct shift in equilibrium; award the mark if the phases are incorrect but the shift is correct based on incorrect phases (see note) | 1–4      |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>8</b> |
| Note: Shift in equilibrium must correspond with phases identified.  |          |

## Question 31

(6 marks)

- (a) Circle **all** the peptide linkages (functional groups that link the monomers) represented in the above structure. (1 mark)

| Description  | Marks    |
|--|----------|
| all peptide linkages identified and circled (end linkages may also be circled) | 1        |
| question incorrectly answered or not attempted or not all linkages circled     | 0        |
| <b>Total</b>   | <b>1</b> |

- (b) Draw the molecular structures of the **three**  $\alpha$ -amino acids that form this segment of insulin. (3 marks)

| Description  | Marks    |
|--|----------|
| $\alpha$ -amino acids correctly drawn (accept zwitterion form) | 1–3      |
| question incorrectly answered or not attempted                 | 0        |
| <b>Total</b>   | <b>3</b> |

- (c) The active form of insulin is made up of two polypeptide chains that contain five alpha helices. State the type of interactions that stabilises these secondary structures and the functional groups involved. (2 marks)

| Type of interaction | Functional groups         |
|---------------------|---------------------------|
| hydrogen bonding    | carbonyl and amide groups |

| Description   | Marks    |
|---|----------|
| recognition that the interaction is hydrogen bonding                    | 1        |
| recognition that the H-bonding is between the carbonyl and amide groups | 1        |
| question incorrectly answered or not attempted                          | 0        |
| <b>Total</b>  | <b>2</b> |

## Question 32

(3 marks)

Below are the structures for the amino acid valine under different pH conditions. In the spaces provided, give the approximate pH range (acidic, basic or neutral) under which each valine structure would exist.

| Valine structure | pH range  |
|------------------|---|
|                  | acidic<br>(pH < 7)<br>or any range of acidic values |
|                  | basic<br>(pH > 7)<br>or any range of basic values   |
|                  | neutral<br>(pH ~ 7)                                 |

| Description                                       | Marks    |
|---|----------|
| 1 mark each (either words or pH range acceptable) | 1–3      |
| question incorrectly answered or not attempted    | 0        |
| <b>Total</b>                                      | <b>3</b> |

## Question 33

(6 marks)

Consider the following reactions and complete the tables that follow.

- (a) An excess of 2-butanol is oxidised by acidified
- $\text{Na}_2\text{Cr}_2\text{O}_7$
- solution. (3 marks)

|  |   |
|--|---|
| <b>Observations</b>  | the solution turns from orange to green |
| <b>Structural formula of organic product</b><br>(show all atoms) |   |
| <b>Name of organic product</b>                                   | butanone                                |

| Description                                    | Marks    |
|--|----------|
| 1 mark for each correct answer in the table    | 1–3      |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>3</b> |

- (b) Butanoic acid reacts with methanol in the presence of
- $\text{H}_2\text{SO}_4$
- solution. (3 marks)

|  |   |
|--|---|
| <b>Observations</b>  | a fruity smell develops<br>(single layer forms) |
| <b>Structural formula of organic product</b><br>(show all atoms) |   |
| <b>Name of organic product</b>                                   | methylbutanoate                                 |

| Description                                    | Marks    |
|--|----------|
| 1 mark for each correct response in the table  | 1–3      |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>3</b> |

Note: One mark deducted in total for question 33 if no hydrogen atoms shown for structures of organic products in question 33 (a) and/or question 33(b).

## Question 34

(6 marks)

Ocean acidification results from carbon dioxide dissolving in water and an equilibrium being established between the water and carbon dioxide to produce carbonic acid, (H<sub>2</sub>CO<sub>3</sub>).

- (a) Write a balanced equation for this equilibrium. (2 marks)

| Description                                    | Marks    |
|--|----------|
| balanced equation                              | 1        |
| double arrows for equilibrium                  | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>2</b> |

- (b) The formation of carbonic acid leads to an increase in the hydronium ion (H<sub>3</sub>O<sup>+</sup>) concentration in water. Show the equilibrium that results in the formation of hydronium ions when carbonic acid reacts with water. (1 mark)

| Description                                    | Marks    |
|--|----------|
| balanced equation                              | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>1</b> |

- (c) State **one** problem ocean acidification is causing for marine organisms. Explain how this problem arises and support your answer with an appropriate balanced equation. (3 marks)

OR

| Description  | Marks    |
|--|----------|
| correct problem stated   | 1        |
| recognition that lowered pH reduces an organism's capacity to form calcium carbonate (or other correct explanation)  | 1        |
| balanced equation (equations showing H <sup>+</sup> are acceptable)  | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>3</b> |
| Note: A range of responses can be accepted around lowered ability of organisms to form calcium carbonate. For example, reduced ability of shell fish or corals to form calcium carbonate because of the potential for CaCO <sub>3</sub> to dissolve at lower pH. (Potential for decreased pH in an organism's body fluids may also be accepted.) |          |

## Question 35

(9 marks)

Complete the table below, which relates to the properties and uses of plastics.

Select from the list below to complete the 'Property' column of the table. A property may only be used **once**. State a different use for each polymer.

- hydrophobic
- high tensile strength
- biodegradable
- rigid
- chemically inert
- heat resistant

| Plastic                          | Type of polymer (addition or condensation) | Property              | Use related to property               |
|----------------------------------|--|-----------------------|---------------------------------------|
| High density polyethene (HDPE)   | addition                                   | high tensile strength | furniture                             |
| Polytetrafluoroethene (Teflon)   | addition                                   | heat resistance       | coating on frypans and other cookware |
| Polyethylene terephthalate (PET) | condensation                               | chemically inert      | drink bottles                         |

| Description   | Marks    |
|---|----------|
| 1 mark for each correct response in the table (any property from the list appropriate to the plastic, can be placed in the property cell) | 1–9      |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>9</b> |
| Note: The use must relate to the property to be awarded the mark, if any property is used a second time, no mark for second use.          |          |

## Question 36

(5 marks)

- (a) Identify these types of interactions, labelled **A**, **B**, **C** and **D**, by completing the table below. (4 marks)

| Label    | Type of interaction             |
|----------|---------------------------------|
| <b>A</b> | dispersion forces               |
| <b>B</b> | ionic bond                      |
| <b>C</b> | covalent bond or disulfide bond |
| <b>D</b> | hydrogen bond                   |

| Description                                    | Marks    |
|--|----------|
| interactions correctly identified              | 1–4      |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>4</b> |

- (b) State what is meant by the ‘tertiary structure’ of a protein. (1 mark)

| Description   | Marks    |
|---|----------|
| the tertiary structure is a protein’s overall 3-dimensional shape | 1        |
| question incorrectly answered or not attempted                    | 0        |
| <b>Total</b>  | <b>1</b> |

## Question 37

(6 marks)

Ethanol may be produced by fermentation or the hydrolysis of ethene. Conditions are indicated in the table below.

|                      | Temperature (°C) | Pressure (kPa) | Raw material                        |
|----------------------|------------------|----------------|-------------------------------------|
| fermentation         | 60               | 101.3          | plant material, (e.g. starch, corn) |
| hydrolysis of ethene | 300              | 7000           | crude oil                           |

- (a) Complete the table above to indicate the raw materials for each process. (2 marks)

| Description                                    | Marks    |
|--|----------|
| plant material, (e.g. starch, corn)            | 1        |
| crude oil                                      | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>2</b> |

- (b) Explain the lower temperature conditions of the fermentation process. (2 marks)

| Description   | Marks    |
|---|----------|
| enzymes catalyse reactions at economic rates at lower temperatures than industrial catalysts (OR Yeast would die at higher temperature) | 1        |
| it uses an enzyme   | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>2</b> |

- (c) In addition to lower temperature conditions, state **two** other advantages of the fermentation process compared with the hydrolysis of ethene. (2 marks)

| Description   | Marks    |
|---|----------|
| advantages: renewable raw material, lower emissions, can be produced from waste material, (any two appropriate reasons) | 1–2      |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>2</b> |

## Section Three: Extended answer

40% (83 Marks)

## Question 38

(22 marks)

- (a) Give **two** reasons why anhydrous sodium carbonate is an appropriate standard. (2 marks)

| Description   | Marks    |
|---|----------|
| Any two of the following: <ul style="list-style-type: none"> <li>it can be obtained with a high degree of purity and has a known formula</li> <li>it undergoes reactions according to known chemical equations</li> <li>it is stable (to air)</li> <li>it has a high formula mass</li> <li>reacts rapidly with acids</li> <li>dissolves readily to give standard solutions</li> </ul> | 1–2      |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>2</b> |

- (b) Calculate the concentration of the standardised HCl solution. (4 marks)

$$n(\text{Na}_2\text{CO}_3) = 0.025 \text{ L} \times 0.0248 \text{ mol L}^{-1} = 6.2 \times 10^{-4} \text{ mol Na}_2\text{CO}_3$$

$$n(\text{HCl}) = 2 \times 6.2 \times 10^{-4} = 1.24 \times 10^{-3} \text{ mol}$$

$$c(\text{HCl}) = \frac{1.24 \times 10^{-3} \text{ mol}}{0.02435 \text{ L}} = 0.05092 = 5.09 \times 10^{-2} \text{ mol L}^{-1}$$

## Fast mark

| Description  | Marks    |
|--|----------|
| concentration = $5.09 \times 10^{-2} \text{ mol L}^{-1}$<br>full marks for any valid method of determining the concentration | 4        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>4</b> |

## Part mark

| Description   | Marks    |
|---|----------|
| balanced reaction equation or correct ratio of reactants  | 1        |
| $n(\text{Na}_2\text{CO}_3) = 6.20 \times 10^{-4} \text{ mol}$   | 1        |
| $n(\text{HCl}) = 1.24 \times 10^{-3} \text{ mol}$   | 1        |
| $5.09 \times 10^{-2} \text{ mol L}^{-1}$<br>(accept answers between $5.04 \times 10^{-2} \text{ mol L}^{-1}$ and $5.14 \times 10^{-2} \text{ mol L}^{-1}$ ) | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>4</b> |

- (c) Below is a list of common errors that can occur in titrations. From this list select **one** source of random error and **one** source of systematic error and explain your choice in the tables below. (4 marks)

- reading of burette
- bubbles in the pipette
- not drying  $\text{Na}_2\text{CO}_3$  in an oven prior to its use as a primary standard
- rinsing all glassware with distilled water
- incorrect indicator
- perception of colour change at the end point

| Description  | Marks    |
|--|----------|
| <b>Random error</b> <ul style="list-style-type: none"> <li>• reading of burette – there is random uncertainty when reading the analogue scale.</li> </ul>  | 1–2      |
| Note: Accept any other error with logical reasoning.   |          |
| <b>Systematic error</b> <ul style="list-style-type: none"> <li>• rinsing all glassware in distilled water – will dilute burette and pipette contents lowering their concentration.</li> <li>• incorrect indicator – the endpoint will not coincide with the equivalence point.</li> <li>• not drying <math>\text{Na}_2\text{CO}_3</math> – will give incorrect concentration of primary standard and so alter the titre volume.</li> <li>• perception of colour change – if readings are taken beyond the point of colour change consistently it will increase titre.</li> </ul> | 1–2      |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>4</b> |

- (d) Account for the need for four trials in the titration. (1 mark)

| Description  | Marks    |
|--|----------|
| to increase precision (reliability) (to obtain results within the uncertainty of the procedure) / to reduce the random error | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>1</b> |

- (e) (i) Calculate the concentration, in moles per litre ( $\text{mol L}^{-1}$ ), of  $\text{Al}(\text{OH})_3$ , in the original  $\text{Al}(\text{OH})_3$  suspension. (5 marks)

$$n(\text{HCl}) = 0.05092 \text{ mol L}^{-1} \times 0.02194 \text{ L} = 1.1171848 \times 10^{-3} \text{ mol}$$

$$n(\text{Al}(\text{OH})_3) = \frac{1.1171848 \times 10^{-3} \text{ mol}}{3} = 3.723949 \times 10^{-4} \text{ mol}$$

$$3.723949 \times 10^{-4} \text{ mol in } 10 \text{ mL}$$

$$x = \text{mol in } 250 \text{ mL}$$

$$x = \frac{3.723949 \times 10^{-4} \times 250}{10} = 9.3098733 \times 10^{-3} \text{ mol in } 250 \text{ mL}$$

$$\text{i.e. } 9.3098733 \times 10^{-3} \text{ mol Al}(\text{OH})_3 \text{ in } 20 \text{ mL of antacid}$$

$$\begin{aligned} c(\text{Al}(\text{OH})_3) &= 9.3098733 \times 10^{-3} \text{ mol} / 0.020 \text{ L} \\ &= 0.47549 \text{ mol L}^{-1} \\ &= 0.475 \text{ mol L}^{-1} \text{ (3 s.f.)} \end{aligned}$$

#### Fast mark

| Description  | Marks    |
|--|----------|
| $c(\text{Al}(\text{OH})_3) = 0.475 \text{ mol L}^{-1}$           | 5        |
| full marks for any valid method of determining the concentration | 5        |
| question incorrectly answered or not attempted                   | 0        |
| <b>Total</b>   | <b>5</b> |

#### Part mark

| Description  | Marks    |
|--|----------|
| balanced equation or correct ratio of reactants.   | 1        |
| $n(\text{HCl}) (1.12 \times 10^{-3})$  | 1        |
| $n(\text{Al}(\text{OH})_3)$ in 10 mL diluted antacid ( $3.72 \times 10^{-4}$ )               | 1        |
| $n(\text{Al}(\text{OH})_3)$ in 20 mL undiluted antacid ( $9.31 \times 10^{-3} \text{ mol}$ ) | 1        |
| calculation of concentration ( $0.475 \text{ mol L}^{-1}$ )                                  | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>5</b> |

- (ii) From his titration of the  $\text{Mg}(\text{OH})_2$  diluted suspension, the student found the mass of  $\text{Mg}(\text{OH})_2$  in the 250 mL **diluted** suspension to be 1.13 g. Determine the concentration of  $\text{Mg}(\text{OH})_2$  in the original **undiluted** suspension and express your answer in moles per litre ( $\text{mol L}^{-1}$ ). (2 marks)

$$n(\text{Mg}(\text{OH})_2) = 1.13 / 58.326 = 0.0193739 \text{ mol}$$

$$c(\text{Mg}(\text{OH})_2) = 0.0193739 \text{ mol} / 0.020 \text{ L} = 0.968693 \text{ mol L}^{-1} = 0.969 \text{ mol L}^{-1}$$

| Description   | Marks    |
|---|----------|
| calculation of moles of $\text{Mg}(\text{OH})_2$ (0.0194 mol) | 1        |
| calculation of concentration (0.969 $\text{mol L}^{-1}$ )     | 1        |
| question incorrectly answered or not attempted                | 0        |
| <b>Total</b>  | <b>2</b> |

- (f) Which of the preparations would be more effective (neutralise more  $\text{HCl}$ ) for a given volume? Show your workings. (4 marks)

$$n(\text{Mg}(\text{OH})_2) \text{ in } 20 \text{ mL of antacid} = 0.0193739 \text{ mol}$$

$\text{Mg}(\text{OH})_2$  neutralises 2 mol of  $\text{HCl}$  per mole =  $2 \times 0.0193739 \text{ mol} = 3.87 \times 10^{-2} \text{ mol HCl}$  neutralised

$$n(\text{Al}(\text{OH})_3) \text{ in } 20 \text{ mL of antacid} = 9.3098733 \times 10^{-3} \text{ mol}$$

$\text{Al}(\text{OH})_3$  neutralises 3 mol of  $\text{HCl}$  per mole =  $3 \times 9.3098733 \times 10^{-3} \text{ mol} = 2.79 \times 10^{-2} \text{ mol HCl}$  neutralised

**Thus  $\text{Mg}(\text{OH})_2$  will be more effective**

| Description  | Marks    |
|--|----------|
| 1 mark each for $n(\text{Mg}(\text{OH})_2)$ and $n(\text{Al}(\text{OH})_3)$ in 20 mL of each of the antacids (transposed from (e)(i) and (e)(ii))                | 1        |
| 1 mark each for number of moles of $\text{HCl}$ neutralised by each antacid  | 1–2      |
| statement that $\text{Mg}(\text{OH})_2$ will be most effective (any valid method e.g. candidate may do a calculation based on 1 mL of antacid rather than 20 mL) | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>4</b> |

## Question 39

(18 marks)

(a) Determine the empirical formula of the compound.

(10 marks)

| Description  | Marks     |
|--|-----------|
| $n(\text{C})=n(\text{CO}_2)=\frac{PV}{RT}=\frac{102.8 \times 0.7007}{8.314 \times 373.15}=2.3218 \times 10^{-2} \text{ mol}$   | 1         |
| $m(\text{C})=12.01 \times 2.3216 \times 10^{-2}=0.27885 \text{ g}$   | 1         |
| $n(\text{H}_2\text{O})=\frac{0.416}{18.016}=2.3090586 \times 10^{-2} \text{ mol}$  | 1         |
| $n(\text{H})=2 \times 2.3090586 \times 10^{-2}=4.6181 \times 10^{-2} \text{ mol}$  | 1         |
| $m(\text{H})=1.008 \times 4.6181 \times 10^{-2}=4.655 \times 10^{-2} \text{ g}$  | 1         |
| $m(\text{O})=0.5096 - (0.27885 + 4.655 \times 10^{-2})=0.18423 \text{ g}$  | 1         |
| $n(\text{O})=\frac{0.18423}{16.00}=1.1514 \times 10^{-2} \text{ mol}$  | 1         |
| $\begin{array}{ccc} \text{C} & \text{H} & \text{O} \\ 0.02319 & 0.04618 & 0.011514 \\ \div \text{ by smallest} & \frac{0.02319}{0.011514} & \frac{0.04618}{0.011514} & 1.000 \\ & 2.014 & 4.011 & 1.000 \\ & 2 & 4 & 1 \end{array}$ <p>1 mark for <math>\div</math> by smallest; 1 mark for rounding</p>   | 1-2       |
| thus EF is $\text{C}_2\text{H}_4\text{O}$  | 1         |
| <b>Total</b>   | <b>10</b> |
| <p>Note:</p> <p>If students don't multiply H <math>\times</math> 2<br/> Ratio 1.79 1.79 1<br/> EF is <math>\text{C}_2\text{H}_2\text{O}</math> 8 marks<br/> <math>\text{C}_9\text{H}_9\text{O}_5</math> 9 marks</p> <p>If students divide H by 2<br/> EF is <math>\text{C}_7\text{H}_6\text{O}_5</math> 9 marks<br/> <math>\text{C}_4\text{H}_2\text{O}_5</math> 9 marks</p> |           |

- (b) A second 0.4832 g sample of the compound was heated to 261 °C. The vaporised sample was found to exert a pressure of 241 kPa in a 100.0 mL container. Use this information to determine the molecular formula of the compound. (5 marks)

| Description   | Marks    |
|---|----------|
| $n(\text{sample}) = \frac{PV}{RT} = \frac{241 \times 0.100}{8.314 \times 534.15} = 5.4268 \times 10^{-3} \text{ mol}$ | 1–2      |
| $M(\text{compound}) = \frac{m}{n} = \frac{0.4832}{5.4268 \times 10^{-3}} = 89.04 \text{ g mol}^{-1}$                  | 1        |
| since empirical formula mass = 44.052   | 1        |
| then MF is 2 × EF<br>= C <sub>4</sub> H <sub>8</sub> O <sub>2</sub>   | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>5</b> |
| Note: If EF is incorrect, the maximum mark possible is 3 marks.   |          |

- (c) When the original compound was reacted with acidified ethanol, it produced a fruity-smelling liquid. Infer the structure of the original compound, and draw its structure in the box below. Name the original compound. (2 marks)

butanoic acid

methylpropanoic acid

OR

| Description  | Marks    |
|--|----------|
| correct structure  | 1        |
| correct name   | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>2</b> |
| Note: Award one mark for correct name for incorrect structure, or incorrect name for correct structure. Must be carboxylic acid structure. |          |

- (d) Describe briefly and give observations for an additional chemical test to confirm the identity of the functional group in the original compound. (2 marks)

| Description   | Marks    |
|---|----------|
| any correct chemical test<br>e.g. react with acid<br>suitable indicator that changes colour at appropriate pH (e.g. Universal Indicator, but not phenolphthalein) | 1        |
| any correct observation   | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>2</b> |
| Note: Addition of MnO <sub>4</sub> <sup>-</sup> and 'no reaction', is not acceptable.   |          |
| Answers could include:  |          |
| <ul style="list-style-type: none"> <li>test – reaction with a carbonate or Mg or Na</li> <li>observation – effervescence</li> </ul>                               |          |

## Question 40

(16 marks)

- (a) State another catalyst that can be used in the production of biodiesel. (1 mark)

| Description                                    | Marks    |
|--|----------|
| lipase   | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>1</b> |

- (b) The vegetable oil in the reaction on page 30 has a molar mass of  $855.334 \text{ g mol}^{-1}$ . If 1.50 tonnes of vegetable oil is reacted, what mass of methanol will be required to react with this amount of oil? (1 tonne =  $1 \times 10^6 \text{ g}$ ) (3 marks)

| Description  | Marks    |
|--|----------|
| $n(\text{veg oil}) = \frac{1.50 \times 10^6}{855.334} = 1.754 \times 10^3 \text{ mol}$   | 1        |
| $n(\text{CH}_3\text{OH}) = 3 \times n(\text{veg oil}) = 5.261 \times 10^3 \text{ mol}$   | 1        |
| $m(\text{CH}_3\text{OH}) = 5.261 \times 10^3 \times 32.042 = 1.69 \times 10^5 \text{ g}$ | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>3</b> |

- (c) Three different methyl esters, denoted by **A**, **B** and **C**, are produced from this reaction. What is the mass of Ester **A** produced in this process if the reaction is 78% efficient in production of this ester? Express your final answer to the appropriate number of significant figures. (5 marks)

| Description   | Marks    |
|---|----------|
| for 100% efficient: $n(\text{A}) = n(\text{Veg oil}) = 1.754 \times 10^3 \text{ mol}$   | 1        |
| 78% efficient, thus $n(\text{A}) = 0.78 \times 1.754 \times 10^3 = 1.368 \times 10^3 \text{ mol}$                             | 1        |
| MF Ester A is $\text{C}_{17}\text{H}_{34}\text{O}_2$ thus $M(\text{A}) = 270.442 \text{ g mol}^{-1}$                          | 1        |
| $m(\text{A}) = 1.368 \times 10^3 \times 270.442 = 3.70 \times 10^5 \text{ g}$   | 1        |
| answer expressed to three significant figures   | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>5</b> |
| Note: The 78% efficiency step can be done based on the theoretical 100% efficient mass of A rather than number of moles of A. |          |

- (d) The glycerol produced can be used as anti-freeze due to its high water solubility. Explain, with the aid of a diagram, why glycerol has water solubility. (5 marks)

Possible diagram

| Description  | Marks    |
|--|----------|
| 1 mark for recognition that both water and glycerol have H-bonding as their predominant type of IMF  | 1        |
| 1 mark for showing that their similar IMFs leads to a high degree of interaction between solvent and solute molecules/formation of H-bonding   | 1        |
| 1 mark for recognising that solubility arises due to the strength of attraction between solute and solvent molecules being sufficient to overcome attraction between solute-solute and solvent-solvent molecules (see note)  | 1–2      |
| 1 mark for a suitable, labelled diagram representing H-bonding between water and glycerol molecules  | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>5</b> |
| <p>Note: An explanation in terms of the competing forces of attraction between solute-solute molecules, solvent-solvent molecules and between solvent-solute molecules is also acceptable. Students may also discuss the energy released when solvent-solute molecules attract being sufficient to overcome the energy to separate solute-solute molecules and solvent-solvent molecules.</p> <p>'Like dissolves like', contains no chemistry and should not be awarded any marks.</p> |          |

- (e) To prevent different products forming in an alternative synthesis pathway, the quantity of sodium hydroxide present in the reaction must be kept low, compared with the vegetable oil. If the mole ratio of NaOH to vegetable oil approaches the ratio 3:1, the alternative pathway becomes significant.

- (i) What type of organic product forms in this alternative pathway? (1 mark)

| Description                                    | Marks    |
|--|----------|
| soap/sodium salt of long chain fatty acid      | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>1</b> |

- (ii) Draw the structure for **one** organic product that forms in the alternative synthesis pathway from this vegetable oil. (1 mark)

| Description   | Marks    |
|---|----------|
| sodium salt for long chain fatty acid component of either A, B or C | 1        |
| question incorrectly answered or not attempted                      | 0        |
| <b>Total</b>  | <b>1</b> |

**Question 41****(10 marks)**

You are supplied with strips of three unknown metals, **A**, **B** and **C**, and are required to determine the order in which they are reduced, from most easily to least easily.

Using a voltmeter, electrical leads and clips, standard laboratory glassware and the typical range of chemicals found in most laboratories, design an investigation and describe the procedures to be followed to determine the order of reduction for the metals. Use a labelled diagram to support your description. Ensure that you explain the purposes of substances or equipment (excluding beakers or other glassware) used.

Indicate the data you will collect and explain how these data give the order of reduction.

| Description  | Marks     |
|--|-----------|
| recognition that 3 Galvanic cells with A and B as electrodes, then A and C as electrodes and B and C as electrodes need to be constructed  | 1         |
| recognition that the cells will need an electrolyte (eg. NaCl dissolved in water or 0.1 mol L <sup>-1</sup> HCl)   | 1         |
| recognition of role of ions as electrolyte to complete the circuit   | 1         |
| recognition that voltmeter needs to be connected in the external circuit to measure potential difference between electrodes  | 1         |
| recognition E(A/B), E(A/C) and E(B/C) is the data that needs to be collected   | 1         |
| recognition that direction of current flow can be used to identify the anode and cathode in each of the cell couples and the magnitude of voltage can be used to order the 3 metals from most easily to least easily reduced | 1–2       |
| labelled diagram to show typical Galvanic cell (electrodes, voltmeter, salt bridge if 2 beakers used)  | 1–2       |
| Recognition of variables to control.<br>any 2 variables e.g. temp, conc. of electrolyte soln, surface area of electrodes in contact with electrolyte   | 1         |
| question incorrectly answered or not attempted   | 0         |
| <b>Total</b>   | <b>10</b> |

## Question 42

(17 marks)

- (a) Write the balanced equation for the reaction of chlorine gas with water. (1 mark)

| Description                                    | Marks    |
|--|----------|
| balanced equation                              | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>1</b> |

- (b) Explain briefly how the addition of hydroxide ions to the water through which the chlorine is bubbled will increase the amount of hypochlorous acid produced. (3 marks)

| Description   | Marks    |
|---|----------|
| recognition that the hydroxide will react with the $\text{H}^+$   | 1        |
| recognition that removal of $\text{H}^+$ will prevent reverse reaction from occurring                                     | 1        |
| recognition that the forward reaction will thus continue until close to completion thus increasing yield of $\text{HOCl}$ | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>3</b> |

- (c) Give the oxidation state of chlorine in hypochlorous acid and the oxidation state of chlorine in hydrochloric acid. (2 marks)

| Oxidation state of Cl in hypochlorous acid | Oxidation state of Cl in hydrochloric acid |
|--|--|
| +1   | -1   |

| Description                                    | Marks    |
|--|----------|
| oxidation state of Cl in $\text{HOCl} = +1$    | 1        |
| oxidation state of Cl in $\text{HCl} = -1$     | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>2</b> |

- (d) Identify the species oxidised and the species reduced when chlorine gas reacts with water. (2 marks)

| Species oxidised | Species reduced |
|------------------|-----------------|
| $\text{Cl}_2$    | $\text{Cl}_2$   |

| Description                                    | Marks    |
|--|----------|
| species oxidised is $\text{Cl}_2$              | 1        |
| species reduced is $\text{Cl}_2$               | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>2</b> |

- (e) Write the half-equation for the reduction of hypochlorous acid to chloride ion. (1 mark)

| Description                                    | Marks    |
|--|----------|
| balanced equation                              | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>1</b> |

- (f) For every one mole of formula units of sodium percarbonate, how many mole of hydrogen peroxide are released when it is dissolved in water? (1 mark)

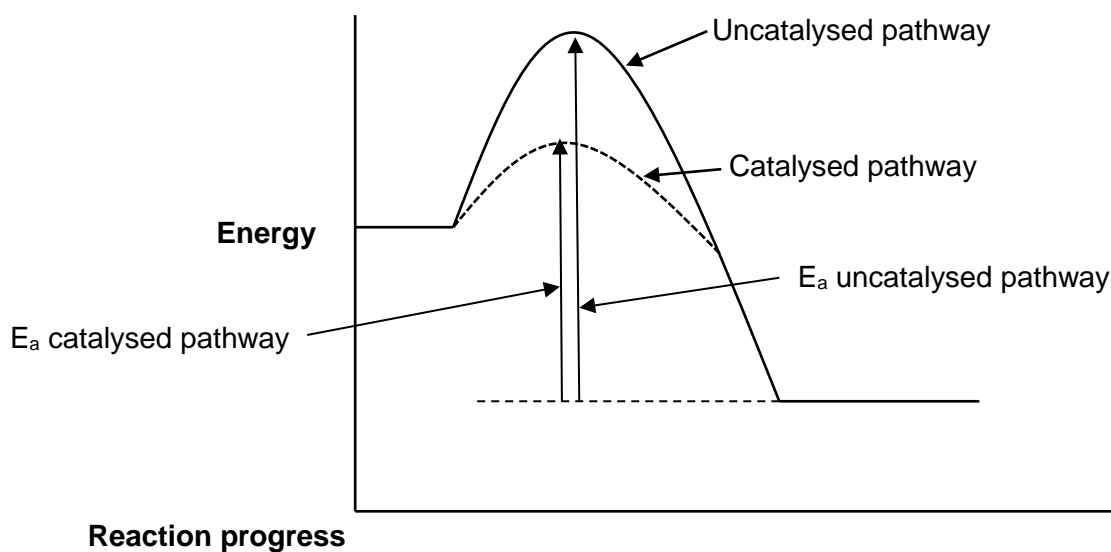

| Description                                    | Marks    |
|--|----------|
| 3 moles  | 1        |
| question incorrectly answered or not attempted | 0        |
| <b>Total</b>                                   | <b>1</b> |

- (g) Compare the activation energy for oxidation reactions involving chlorine-based bleaches to those using peroxide-based bleaches (in the absence of catalysts). Explain the reasons for your answer. (2 marks)

| Description   | Marks    |
|---|----------|
| activation energy for oxidation of peroxides is higher than $E_a$ of chlorine based bleaches                        | 1        |
| the oxidation of peroxide based bleaches requires higher temperatures than for oxidation of chlorine based bleaches | 1        |
| question incorrectly answered or not attempted  | 0        |
| <b>Total</b>  | <b>2</b> |

- (h) Draw a fully labelled energy profile diagram showing the progress of the decomposition of hydrogen peroxide with and without TAML molecules. (4 marks)

The equation for the reaction is  $2\text{H}_2\text{O}_2 \rightarrow 2\text{H}_2\text{O} + \text{O}_2 + \text{energy}$ .

| Description  | Marks    |
|--|----------|
| vertical axis labelled energy and horizontal axis labelled progress of reaction (or similar)   | 1        |
| curve for both catalyst free and catalysed pathways shown with $E_a$ of catalysed pathway less than $E_a$ for uncatalysed pathway; curves labelled correctly | 1        |
| $E_a$ labelled for both pathways   | 1        |
| curve is for exothermic reaction   | 1        |
| question incorrectly answered or not attempted   | 0        |
| <b>Total</b>   | <b>4</b> |
