**alkali metals**  
all form +1 ions  
similar extreme chemical behaviour

**alkaline earth metals**  
all form ions with a +2 charge  
react similar to alkali metals but slightly less reactive

for both alkali metals and alkaline earth metals, reactivity increases as size increases. Metals become less stable and more likely to react as hold onto valence e<sup>-</sup> weakens.

**halogens**  
all form ions with a -1 charge  
the bigger the atom, the less reactive

↑ reactivity increases as you go up, the smaller the atom is  
to produce colourful, poisonous vapours

↑ electronegativity  
don't react or form bonds  
stable  
exist on their own (no no atoms)
