Materials required/recommended for this paper

To be provided by the supervisor:

This Question/Answer Booklet Multiple-choice Answer Sheet Chemistry Data Book

To be provided by the candidate:

Standard items: pens (blue/black preferred), pencils (including coloured), sharpener,

eraser, correction tape/fluid, ruler, highlighters

Special items: up to three calculators, which do not have the capacity to create or

store programmes or text, are permitted in this ATAR course

examination

Important note to candidates

No other items may be taken into the examination room. It is **your** responsibility to ensure that you do not have any unauthorised material. If you have any unauthorised material with you, hand it to the supervisor **before** reading any further.

Structure of this paper

| Section | Number of questions available | Number of questions to be answered | Suggested working time (minutes) | Marks available | Percentage of examination |
|----------------------------------|-------------------------------------|------------------------------------|--|--------------------|---------------------------|
| Section One Multiple-choice | 25 | 25 | 50 | / 25 | / 25 |
| Section Two Short answer | 7 | 7 | 60 | / 67 | / 35 |
| Section Three Extended answer | 5 | 5 | 70 | /76 | / 40 |
| | | | | | / 100 |

Instructions to candidates

- 1. Write your answers in this Question/Answer booklet preferably using a blue/black pen. Do not use erasable or gel pens.
- 2. Answer the questions according to the following instructions.

Section One: Answer all questions on the separate Multiple-choice answer sheet provided. For each question, shade the box to indicate your answer. Use only a blue or black pen to shade the boxes. Do not use erasable or gel pens. If you make a mistake, place a cross through that square, then shade your new answer. Do not erase or use correction fluid/tape. Marks will not be deducted for incorrect answers. No marks will be given if more than one answer is completed for any question.

Sections Two and Three: Write your answers in this Question/Answer Booklet.

- 3. When calculating numerical answers, show your working or reasoning clearly. Your working should be in sufficient detail to allow your answers to be checked readily and for marks to be awarded for reasoning. Express numerical answers to the appropriate number of significant figures and include appropriate units where applicable.
- 4. You must be careful to confine your responses to the specific questions asked and to follow any instructions that are specific to a particular question.
- 5. Supplementary pages for planning/continuing your answers to questions are provided at the end of this Question/Answer booklet. If you use these pages to continue an answer, indicate at the original answer where the answer is continued, i.e. give the page number.
- 6. The Chemistry Data Book is not to be handed in with your Question/Answer booklet.

Section One: Multiple-choice

25% (25 marks)

This section has **25** questions. Answer **all** questions on the separate Multiple-choice answer sheet provided. For each question, shade the box to indicate your answer. Use only a blue or black pen to shade the boxes. Do not use erasable or gel pens. If you make a mistake, place a cross through that square, then shade your new answer. Do not erase or use correction fluid/tape. Marks will not be deducted for incorrect answers. No marks will be given if more than one answer is completed for any question.

Suggested working time: 50 minutes.

- 1. Which of the following statements regarding an atom of neon-20 is correct?
 - (a) The atomic number is 20.
 - (b) The mass number is 20.
 - (c) The number of neutrons is 20.
 - (d) The number of electrons is 20.
- 2. Consider the equations below showing the behaviour of sulfurous acid when dissolved in water.

I.
$$H_2SO_3(aq) \rightleftharpoons H^+(aq) + HSO_3^-(aq)$$

II.
$$HSO_3^-(aq) \rightleftharpoons H^+(aq) + SO_3^{2-}(aq)$$

Based on these equations which of the following conclusions can be made about sulfurous acid?

- (a) It is a strong diprotic acid.
- (b) It is a strong acid.
- (c) It is a weak diprotic acid.
- (d) It has a pH above 7.
- 3. Which of the formulae in the table below correctly match the names given?

| | Name | Formula |
|-------|---------------------------|-----------------------------------|
| (i) | dinitrogen tetroxide | N ₂ O ₄ |
| (ii) | strontium nitrite | SrNO ₂ |
| (iii) | lithium hydrogenphosphate | Li ₂ HPO ₄ |
| (iv) | iron(III) cyanide | Fe ₂ (CN) ₃ |
| (v) | sodium oxalate | Na ₂ O |

- (a) (i) and (iv) only.
- (b) (ii) and (iii) only.
- (c) (i) and (iii) only.
- (d) (ii) and (v) only.

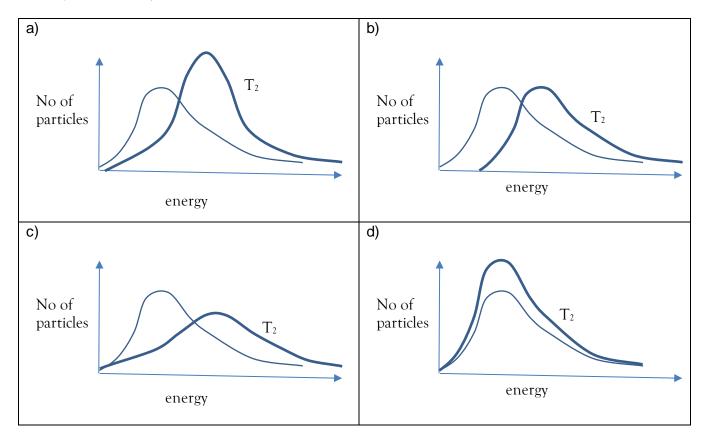

- 4. The aqueous solubility of a particular solute is being investigated. As the temperature of the water decreases, the solubility of the solute would likely **increase** if the solute
 - (a) was a gas.
 - (b) was a solid.
 - (c) was polar.
 - (d) was non-polar.
- 5. A student wrote three sentences describing the structure of graphite.
 - It consists of layers or sheets of **carbon** atoms which form flat hexagonal rings.
 - II Each **carbon** atom is connected to three other **carbon** atoms by covalent bonds.
 - III There are no covalent bonds existing between each layer of **carbon** atoms

Which of these statements are correct?

- (a) I only
- (b) I and II only
- (c) I and III only
- (d) I, II and III
- 6. Which pair of statements explains the increase in the rate of a reaction when the temperature is increased or a catalyst is added?

| | Increasing temperature | Adding a catalyst |
|-----|---|---|
| (a) | activation energy decreases | activation energy increases |
| (b) | change in enthalpy(ΔH) decreases | average kinetic energy of the particles increases |
| (c) | average kinetic energy of the particles increases | activation energy decreases |
| (d) | number of particles increases | change in enthalpy(ΔH) decreases |

7. The sample of gas, in a closed system, is heated to a higher temperature, T₂. Four chemistry students were asked to draw the curve that represents the distribution of energy at this new temperature. They are shown below, which one is correct?

- 8. Which of the following statements is/are correct for particles in the transition state of a chemical reaction?
 - (i) They can quickly form reactants.
 - (ii) They can quickly form products.
 - (iii) They have maximum enthalpy.
 - (a) (ii) only.
 - (b) (i) and (ii) only.
 - (c) (ii) and (iii) only.
 - (d) All of (i), (ii) and (iii).

Questions 9, 10 and 11 relate to the information provided in the partially completed table below.

| | Symbol | Number of protons | Number of neutrons | Number of electrons |
|---|-------------------------------|-------------------|--------------------|---------------------|
| V | ²² Na | | 11 | |
| W | | 15 | 15 | 15 |
| Х | ²² Na ⁺ | 11 | | |
| Y | 31p3- | | | 18 |
| Z | | 13 | | 10 |

- 9. Which two species are isotopes?
 - (a) V and X.
 - (b) W and Y.
 - (c) X and Z.
 - (d) V and Z.
- 10. Which two species have the same electron configuration?
 - (a) V and X.
 - (b) W and Y.
 - (c) X and Z.
 - (d) V and Z.
- 11. The radius of
 - (a) V is less than that of W.
 - (b) X is less than that of Z.
 - (c) Y is less than that of W.
 - (d) X is less than that of V.
- 12. Consider the chemical reaction below.

$$2 SO_2(g) + O_2(g) \rightarrow 2 SO_3(g)$$

Which of the following changes would **not** increase the rate of reaction?

- (a) Increasing the concentration of SO₂(g) in the system.
- (b) Increasing the volume of the system.
- (c) Increasing the temperature of the system.
- (d) Adding an appropriate catalyst to the system.

Chemistry Units 1 & 2

- 13. The semi-structural formula of 4,4-dimethylpent-2-ene is
 - (a) (CH₃)₃CCH₂CHCH₂
 - (b) CH₃C(CH₃)₂CH(CH₃)CH₃
 - (c) CH₃CHCHC(CH₃)₂CH₃
 - (d) CH₃CH₂CH(CH₃)CH(CH₃)CH₃
- 14. Which one of the following substances will have the highest boiling point?
 - (a) methane (CH₄)
 - (b) ethane (CH₃CH₃)
 - (c) dichloroethane (CH₃CHCl₂)
 - (d) dichloromethane (CH₂Cl₂)

Questions 15 and 16 relate to the information below.

Four (4) beakers labelled W, X, Y and Z, were known to contain the following 0.5 mol L^{-1} solutions; $Na_2S(aq)$, $K_2CO_3(aq)$, $ZnCl_2(aq)$ and $Pb(NO_3)_2(aq)$.

In order to find the identity of the solutions, samples were taken from each of the beakers and mixed. The table below shows which samples were mixed, as well as the corresponding observations.

| | W | X | Y |
|---|--------------------|---------------------|---------------------|
| Х | white solid formed | | No visible reaction |
| Y | white solid formed | no visible reaction | |
| Z | white solid formed | white solid formed | grey solid formed |

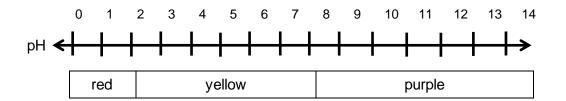

- 15. The formula of the grey solid produced when samples from beakers Y and Z were mixed is
 - (a) Pb(NO₃)₂.
 - (b) PbCl₂.
 - (c) PbCO₃.
 - (d) PbS.
- 16. The results in the table demonstrate that ZnCl₂(aq) was in beaker
 - (a) W.
 - (b) X.
 - (c) Y.
 - (d) Z.

17. A sample of juice was being analysed by high-performance liquid chromatography (HPLC) to confirm whether citric acid was present. Subsequently, the results of the analysis were compared to a calibration curve to determine the concentration of citric acid in the juice.

In order for the data to be reliable, the HPLC conditions used for the citric acid analysis must be the same as those used to produce the citric acid calibration curve. These are referred to as 'controlled variables'.

Which of the following is **not** a variable that needs to be controlled in this investigation?

- (a) The stationary phase.
- (b) The mobile phase.
- (c) The pressure applied.
- (d) The amount of sample loaded.
- 18. Which one of the following does **not** have an electron configuration of 2,8,8?
 - (a) Ar
 - (b) Al³⁺
 - (c) CI
 - (d) Ca²⁺
- 19. Activation energy is the
 - (a) minimum amount of energy released in a chemical reaction.
 - (b) maximum amount of energy released in a chemical reaction.
 - (c) minimum amount of energy required for a chemical reaction to occur.
 - (d) maximum amount of energy required for a chemical reaction to occur.
- 20. Metacresol purple is a pH indicator exhibiting three (3) different colours, as shown in the diagram below.

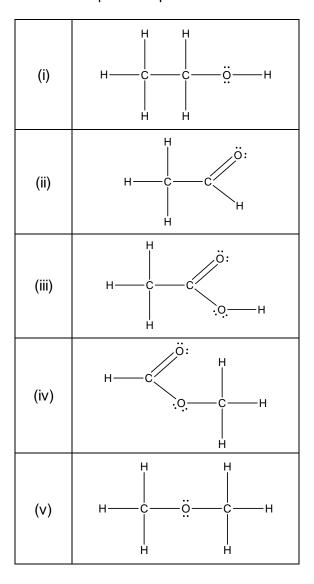

Which of the solutions below would be **least** likely to turn yellow, when several drops of metacresol purple are added to it?

- (a) $H_2O(I)$
- (b) $NH_3(aq)$
- (c) NaCl (aq)
- (d) NaOH(aq)

Chemistry Units 1 & 2

21. Which of the organic substances below would exhibit dipole-dipole forces but **not** hydrogen bonding between molecules in a pure sample?

- (a) (i) and (v) only.
- (b) (ii) and (iv) only.
- (c) (ii), (iii) and (v) only.
- (d) (ii), (iv) and (v) only.
- 22. Which one of the following rows correctly classifies each substance?

| | Hydrogen peroxide (H₂O₂) | Ethanoic acid (CH₃COOH) | Ammonium carbonate ((NH ₄) ₂ CO ₃) |
|-----|-----------------------------|----------------------------|--|
| (a) | Non-electrolyte | Strong electrolyte | Weak electrolyte |
| (b) | Non-electrolyte | Weak electrolyte | Strong electrolyte |
| (c) | Weak electrolyte | Strong electrolyte | Weak electrolyte |
| (d) | Weak electrolyte | Non-electrolyte | Strong electrolyte |

Questions 23 and 24 refer to the following three (3) organic reactions.

- (i) $CH_3CHCHCH_3 + H_2O \rightarrow X$
- (ii) CH₃CH₃ + Y \rightarrow CH₂CICH₃ + HCI
- (iii) $CH_3CH_2CH_2Br + NaOH \rightarrow CH_3CH_2CH_2OH + Z$
- 23. Which of the following options correctly identifies substances X, Y and Z?

| | X | Υ | Z |
|-----|--|--------|-----------------|
| (a) | CH ₃ CH ₂ CHOHCH ₃ | Cl_2 | NaBr |
| (b) | CH ₃ CHOHCH ₂ CH ₃ | HCI | NaBr |
| (c) | CH ₃ CHOHCH ₂ CH ₃ | Cl_2 | HBr |
| (d) | CH ₃ CH ₂ CH ₂ CH ₂ OH | HCI | Br ₂ |

- 24. Which of these would be classified as a substitution reaction?
 - (a) (i) only.
 - (b) (ii) only.
 - (c) (i) and (iii) only.
 - (d) (ii) and (iii) only.
- 25. Which one of the following processes is exothermic?
 - (a) melting gold
 - (b) evaporating water
 - (c) freezing carbon dioxide
 - (d) boiling water

Chemistry Units 1 & 2

Question 31 (9 marks)

Thin layer chromatography (TLC) can be used to detect the presence of preservatives in different cosmetics. A glass plate coated in polar silica gel is used as the stationary phase. The mobile phase is a benzene-propanone (8:2) mixture.

(a) Complete the following table regarding the components of the mobile phase. (3 marks)

| | Benzene | Propanone |
|--|---------|-----------|
| Structural diagram | | |
| 'Polar' or 'non-polar' substance | | |

Using the conditions described above, several preservatives were analysed by TLC. Once separated, the preservatives were visualised by UV detection. The retention factor values were calculated using the formula;

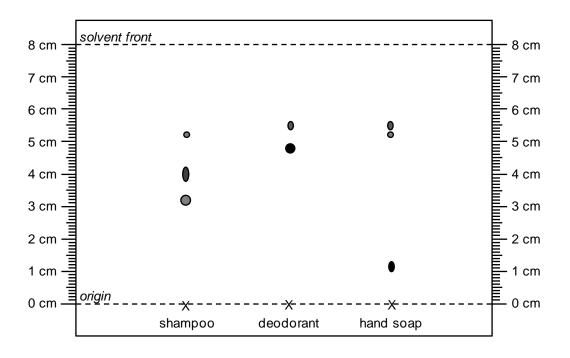

Retention factor (R_f) = <u>distance travelled by component</u> distance travelled by solvent

The results of this analysis are provided in the table below.

| Preservative | Rf |
|-----------------------|------|
| Dichlorophene | 0.50 |
| Fluorosan | 0.56 |
| Hexachlorophene | 0.14 |
| Salicylanilide | 0.65 |
| Tribromsalan | 0.60 |
| Chlorhexidine acetate | 0.40 |
| Phenylphenol | 0.68 |

| Which of these pre | servatives is the | most polar? | Justify y | our ans | wer. | (4 m |
|--------------------|-------------------|-------------|-----------|---------|------|------|
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

Three cosmetic products; shampoo, deodorant and hand soap; were then analysed by TLC under identical conditions. A diagram of the resultant TLC plate is provided below.

(c) Which cosmetic product is most likely to contain tribromsalan? (1 mark)

(d) Give one (1) reason that it cannot be known for certain that tribromsalan is in this cosmetic product.

(1 mark)

Question 32 (9 marks)

Hydrogen peroxide is a colourless solution which decomposes into water and oxygen gas under standard laboratory conditions.

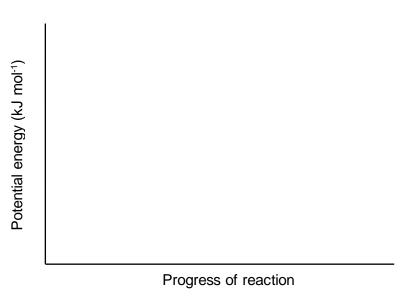

The enthalpy change for this reaction is given as; $\Delta H = -196 \text{ kJ mol}^{-1}$ of hydrogen peroxide.

| (a) | Write a balanced thermochemical equation representing this reaction. | (3 marks) |
|-----|--|-----------|
| | | |

(b) Suggest one (1) method for measuring the rate of this reaction. (1 mark)

The rate of this reaction can be greatly enhanced by adding some solid manganese(IV) oxide catalyst to the hydrogen peroxide solution. The activation energy, in the presence of the catalyst, is 23 kJ mol⁻¹.

(c) On the axes below, sketch an energy profile diagram for the catalysed and uncatalysed reactions. Label the enthalpy change and the activation energy. (4 marks)

(d) Suggest one (1) method, not related to the manganese(IV) oxide catalyst, that would further increase the rate of this reaction. (1 mark)

| 20 | Chemistry Units | 1 & 2 |
|----|-----------------|-------|
| | | |

End of Section Two

Chemistry Units 1 & 2 21

Section Three: Extended answer

40% (76 marks)

This section contains **five (5)** questions. You must answer **all** questions. Write your answers in the spaces provided below.

Where questions require an explanation and/or description, marks are awarded for the relevant chemical content and also for coherence and clarity of expression. Lists or dot points are unlikely to gain full marks.

Final answers to calculations should be expressed to the appropriate number of significant figures and include appropriate units where applicable.

Supplementary pages for planning/continuing your answers to questions are provided at the end of this Question/Answer booklet. If you use these pages to continue an answer, indicate at the original answer where the answer is continued, i.e. give the page number.

Suggested working time: 70 minutes.

Question 33 (15 marks)

The Sabatier process was developed in 1897 by the French chemist Paul Sabatier. In this reaction, carbon dioxide and hydrogen gas are converted to methane and water vapour as shown in the chemical equation below.

$$CO_2(g) + 4 H_2(g) \rightarrow CH_4(g) + 2 H_2O(g)$$

The Sabatier process is conducted at a temperature of approximately 400 °C and a pressure of 30 atmospheres (i.e. 30 times atmospheric pressure).

The Sabatier process is used by NASA on board the International Space Station, to produce water for the crew. The chemical equation for the Sabatier process is provided again below, for convenience.

$$CO_2(g) + 4 H_2(g) \rightarrow CH_4(g) + 2 H_2O(g)$$

The carbon dioxide exhaled by the astronauts is collected and reacted with hydrogen gas that forms as a by-product of a different on-board reaction. The water vapour is cooled and condensed into a liquid. This produces 2495 kg of water each year.

Question 34 (17 marks)

Floatation tanks (float tanks, sensory deprivation tanks) are lightless, soundproof tanks containing a salt solution which is dense enough to enable the user to float. Float tanks are said to provide benefits such as relaxation and pain relief, as well as improved sleep, circulation and immunity.

Float tanks contain around 1000 L of salt solution. This solution contains a very high concentration of Epsom salts, MgSO₄.7H₂O(s), which is maintained at 35 °C. The resulting MgSO₄(aq) solution is designed to be just under saturation point. If too little salt is added, the solution will not be dense enough to allow the user to float. If too much salt is added, crystals of solute form and may block water filtering equipment.

| (a) | Distinguish between a saturated and an uns | saturat | ed solution. | | (2 mark |

| The pl | H of the salt solution must also be monitored and should fall between 6.8 and 7.6. |
| (g) | define the term pH? (1 mark) |

Question 35 (12 marks)

'Hardness' in water is caused by dissolved calcium compounds. When heated some of these decompose and solid calcium carbonate can form as follows:

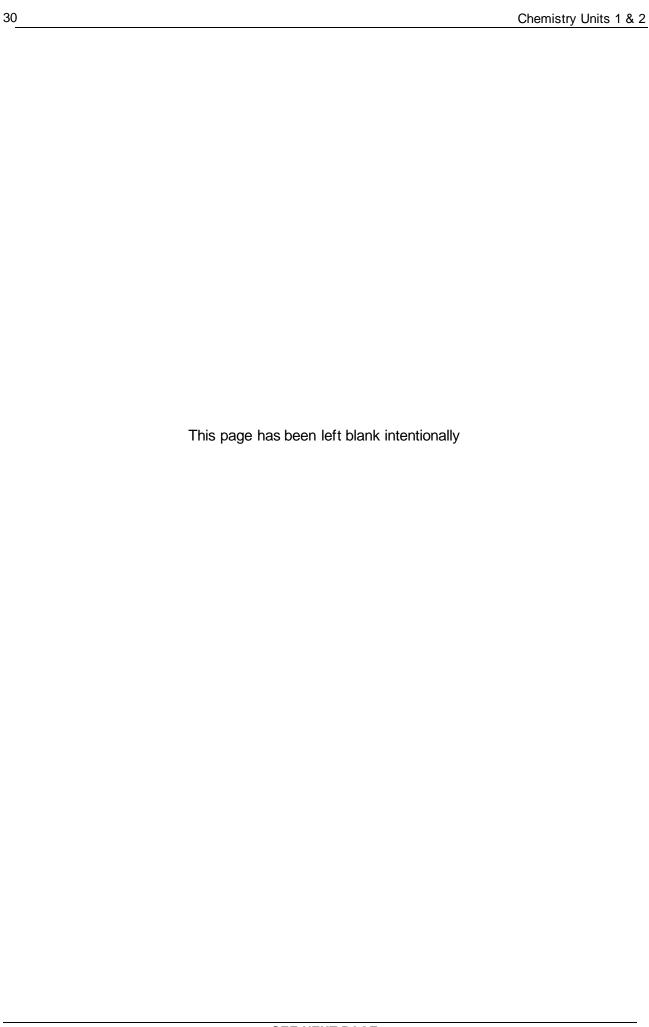

$$Ca(HCO_3)_2(aq) \rightarrow CaCO_3(s) + 2 H_2O(\ell) + 2 CO_2(g)$$

This calcium carbonate can build up as 'fur' inside containers. It can be removed by reaction with hydrochloric acid.

Chemistry Units 1 & 2 31 **Question 36** (17 marks) Sulfuric acid is used at the electrolyte in car batteries. (a) Using the example of sulfuric acid explain what is meant by a strong acid. Use an equation in your answer. (3 marks) (b) The concentration of sulfuric acid in a car battery is found to be 2.15 mol L⁻¹. A car battery contains 0.650 L of sulfuric acid. (i) Calculate the mass of sulfuric acid in the car battery. (3 marks) Assuming the density (d=m/V) of the acid in the battery is 1.07 g mL⁻¹ calculate the (ii) concentration of the sulfuric acid as a percentage by mass. (2 marks) (c) The car battery was damaged and 0.300 L of the acid leaked onto the floor of the garage. 475 mL of a solution of 2.75 mol L⁻¹ sodium hydroxide was used to neutralise the acid. Show by calculation that this was just enough to neutralise all the spilt acid. (4 marks)

| (d) | Powdered aluminium oxide was then sprinkled over the area of the spillage to remove any excess chemicals. Aluminium oxide is an amphoteric substance, which means it can act as an acid or a base. | | | | | | | |
|-----|--|--|--|--|--|--|--|--|
| | (i) | Explain why aluminium oxide is the substance chosen to complete the clean-up process (2 marks) | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | (ii) | Use your knowledge of reaction rates to explain why the aluminium oxide was used in a powdered form. (3 marks) | | | | | | |
| _ | | | | | | | | |

Question 37 (15 marks)

The first periodic table of the elements was designed by the Russian chemist Dmitri Mendeleev, and was published in 1869. The periodic table arranges the elements according to recurring trends.

The seven rows of the periodic table are called periods. Consider the elements in period 3, as shown below.

| | Na | Mg | Al | Si | Р | S | CI | Ar | |
|-------|---------------------------|------------------------------|--------------|--------------|--------------|--------------|--------------|-------------|---------|
| (a) | What fea | ature do the | se period 3 | elements l | have in co | mmon? | | (1 m | ark) |
| | | | | | | | | | |
| As yo | ou move fro e elements | om left to riç increase. | ght across p | period 3, bo | th the first | ionisation e | nergy and | electronega | ativity |
| (b) | Define 'f observed | irst ionisatio d in each. | on energy' a | and 'electro | negativity', | , and explai | n the increa | | arks) |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |

Now consider the chlorides of the period 3 elements;

| N | NaCl | MgCl ₂ | AICI ₃ | SiCl ₄ | PCI ₃ | SCl ₂ | Cl ₂ | |
|---|------|-------------------|-------------------|-------------------|------------------|------------------|-----------------|--|
|---|------|-------------------|-------------------|-------------------|------------------|------------------|-----------------|--|

The first three of these chloride compounds are considered to exhibit ionic bonding, whilst the latter four are classified as covalent compounds.
