## Volumetric Analysis 2

## To standardise hydrochloric acid

#### Introduction

In the last practical you prepared a standard solution of sodium carbonate. Today, you will use it to find the concentration of dilute hydrochloric acid by titration. This process is known as **standardising** the hydrochloric acid.

The reaction between sodium carbonate and hydrochloric acid takes place in two stages:

$$Na_2CO_3(aq) + HCl(aq) \rightarrow NaHCO_3(aq) + NaCl(aq)$$
 (1)

$$NaHCO_3(aq) + HCl(aq) \rightarrow NaCl(aq) + CO_2(g) + H_2O(l)$$
 (2)

Two indicators are needed to cover both stages:

- in stage 1, phenolphthalein is most suitable, and will respond to the pH change associated with the formation of sodium hydrogencarbonate, NaHCO<sub>3</sub>.
- in stage 2, methyl orange is most suitable, and will respond to the pH change associated with the final formation of sodium chloride, NaCl.

As a result, this practical gives you experience of titration using two different indicators (the phenolphthalein colour change is easy to spot, whereas the methyl orange colour change is quite difficult to judge).

### **Apparatus**

Goggles
Bench mat
100cm³ beaker
250cm³ beaker
250cm³ conical flask
25cm³ bulb pipette
Pipette filler
Burette
Burette stand and holder

Plastic filter funnel
White tile
Teat pipette
Access to:

your standard sodium carbonate solution dilute hydrochloric acid to standardise phenolphthalein indicator solution methyl orange indicator solution

#### **Methods**

- 1. Transfer a 25cm<sup>3</sup> aliquot (portion) of your sodium carbonate solution to a 250cm<sup>3</sup> capacity conical flask. Add a few drops of phenolphthalein indicator solution.
- 2. Titrate with the hydrochloric acid. The end-point of the titration is when the solution just changes from pink to colourless. Note the titre, then add a few drops of methyl orange.
- 3. Titrate with the hydrochloric acid. The end-point of the titration is when the solution just changes from yellow to red. Note the second titre.
- 4. Repeat steps 1 3 until concordance (i.e. until the readings are the same or within 0.1cm<sup>3</sup>). Tabulate your titrations as described in *The Burette* sheet. You will need two sets of tables.
- 5. After tidying away, do the calculations described overleaf.

#### **Calculations**

1. Calculate the  $M_r$  of  $Na_2CO_3$ .

$$A_r(Na) = 23$$
  $A_r(C) = 12$   $A_r(O) = 16$ 

- 2. Look back at the accurate mass of sodium carbonate you used in the last practical. Using your answer to step 1, calculate the number of moles of Na<sub>2</sub>CO<sub>3</sub> that you dissolved in 250cm<sup>3</sup> of water during *Volumetric Analysis 1*.
- 3. Use your answer to step 2 to calculate the number of moles of Na<sub>2</sub>CO<sub>3</sub> in the 25cm<sup>3</sup> transferred to the conical flask.

#### Stage 1 Phenolphthalein results

4. The equation for the first stage of the reaction between sodium carbonate and hydrochloric acid is shown below again:

$$Na_2CO_3(aq) + HCl(aq) \rightarrow NaHCO_3(aq) + NaCl(aq)$$

From the equation, you can see that 1 mole of Na<sub>2</sub>CO<sub>3</sub> will react with 1 mole of HCl.

How many moles of HCl will react with the number of moles of Na<sub>2</sub>CO<sub>3</sub> calculated in step 3?

5. The answer to step 4 tells you how many moles of HCl were in your first mean titre. Divide this number by the volume of the first mean titre: this is the concentration of HCl in mol dm<sup>-3</sup>.

### Stage 2 Methyl orange results

6. The equation for the second stage of the reaction between sodium carbonate and hydrochloric acid is shown below again:

$$NaHCO_3(aq) + HCl(aq) \rightarrow NaCl(aq) + CO_2(g) + H_2O(l)$$

From the equation, you can see that 1 mole of NaHCO<sub>3</sub> will react with 1 mole of HCl.

The number of moles of NaHCO<sub>3</sub> is equal to the number of moles of Na<sub>2</sub>CO<sub>3</sub>. How many moles of HCl will react with the number of moles of NaHCO<sub>3</sub> calculated in step 3?

- 7. The answer to step 6 tells you how many moles of HCl were in your second mean titre. Divide this number by the volume of the second mean titre: this is also the concentration of HCl.
- 8. Your answers to steps 5 and 7 should be identical. Comment on your findings.
