TRIAL TEST 5: CHEMICAL SYNTHESIS

Time allowed: 70 minutes Section 1 - Multiple Choice Total marks: 80

20 marks

Section 2 - Short & Extended Answer

60 marks

SECTION 1 - MULTIPLE CHOICE (20 MARKS)

- 1. Which of the following compounds would be best to mix with warm water to help remove cooking oil from a fry pan?
 - C₇H₁₆ (a)
 - CH, CHO (b)
 - CH, COOCH, (c)
 - C16H,2COONa (d)
- 2. The cleansing action of soaps is decreased when water contains which of the following ions:
 - I. Na+ ions
 - Ca2+ ions II.
 - NO3-ions III.
 - Mg2+ ions IV.
 - I only (a)
 - (b) II only
 - II, III and IV (c)
 - (d) II and IV
- 3. Which of the following statements about soaps is true?
 - Soaps dissolve oils by forming hydrogen bonds with the hydrophilic section of (a) the oil
 - (b) Soaps are unable to lather in hard water as scum forms when the stearate ion forms a polymerised precipitate with divalent anions in the water.
 - Soaps dissolving oils involves the alkyl region of soap ions being attracted to and (c) then surround small globules of oil molecules.
 - (d) Soaps are sulfonated esters of long chain fatty acids.
- Which of the following statements about the production of alcohol by fermentation is 4. not true?
 - Fermentation involves biological catalysts aiding the breakdown of the starch (a) polymer into its monomer units.
 - Carbon dioxide is formed when the enzymes in yeast catalyse the breakdown of (b) glucose.
 - (c) To be pure enough for use as a biofuel, the yeast and starch must be distilled.
 - The alcohol to be used is purified by passing it through a molecular sieve. (d)
- For use as a supplement to petrol, alcohol can be produced by fermentation or by: 5.
 - (a) The reduction of ethanoic acid obtained from the oxidation of grape vinegar.
 - (b) The hydrolysis of ethene obtained from the cracking of hydrocarbons produced in the petroleum industry.
 - The bi-product of the base catalysed esterification of triglycerides. (c)
 - (d) The de-poylermisation of polyethene.

6. Which of the following molecules would be suitable for use as a biofuel?

Questions 7 and 8 refer to the following stages in the production of sulfuric acid:

$$\begin{split} &S(s) \ + \ O_2(g) \ \rightarrow \ SO_2(g) \ + \ 297 \ kJ \ mol^{-1} \\ &2SO_2(g) \ + \ O_2(g) \ \rightleftharpoons \ 2 \ SO_3(g) \ + \ 198 \ kJ \ mol^{-1} \\ &SO_3(g) \ + \ H_2SO_4(l) \ \rightarrow \ H_2S_2O_7(l) \\ &H_2S_2O_7(l) \ + \ H_2O(l) \ \rightarrow \ 2 \ H_2SO_4(l) \end{split}$$

7. Which of the following statements is most correct?

- (a) The production of sulfur trioxide is carried out at the moderately high temperature of 450°C due to reaction rate considerations rather than yield considerations.
- (b) The equilibrium yield of sulfur trioxide is favoured by a high pressure in the reaction vessel however the cost of building high-pressure reaction vessels means that a high temperature is used instead.
- (c) Sulfur trioxide is dissolved in sulfuric acid rather than water because the product $H_2S_2O_7$ is much more soluble in water and consequently this additional step increases the yield of sulfuric acid.
- (d) The burning of the sulfur to produce sulfur dioxide must be carried out at a low temperature to ensure that the sulfur is not liquefied before combustion as liquid sulfur will inhibit the action of the vanadium catalyst.
- 8. When 32 g of sulfur is burnt in 32 g of oxygen
 - (a) 196 g of sulfuric is produced
 - (b) 64 g of sulfur dioxide is produced
 - (c) 80 g of sulfur trioxide would be produced
 - (d) 32 g of water is consumed to produce the sulfuric acid.
- 9. A 25.0 g sample of lead ore, predominantly PbS, was reduced to pure lead by the following process:

$$2 \text{ PbS} + 3 \text{ O}_2 \rightarrow 2 \text{ PbO} + 2 \text{ SO}_2$$

$$2 \text{ PbO} + \text{C} \rightarrow 2 \text{ Pb} + \text{CO}_2$$

If the lead ore was 63.5% PbS the mass of pure lead that could be obtained from the

25.0 g sample is:

- 15.9 g 6.74 g (a)
- (b)
- 13.7 g (c)
- 27.4 g (d)
- What mass of ammonia could be collected when 14.7 g of ammonium chloride mixed with 24.5 g of calcium hydroxide and heated? 10.

 $2 \text{ NH}_4\text{Cl} + \text{Ca(OH)}_2 \rightarrow \text{CaCl}_2 + 2 \text{ NH}_3 + 2 \text{ H}_2\text{O}$ (a) 14.7 g

- 5.6 g (b)
- 11.2 g (c)
- (d) 4.7 g

SECTION 2 – SHORT AND EXTENDED ANSWER (60 MARKS)

11. A soap is to be made from a fat with the formula as shown below:

(a)	Write the equation for the reaction of this tristearate with NaOH to fo	rm soap
S-		
73		
		[4 mark
(b)	With the aid of a diagram explain how soap can clean a dirty plate.	
		[4 marl
(c)	Briefly explain why a sample of water would be classified as hard, incl names of chemical species causing this.	ude the
: 		
a		

d)	Draw the structure of a typical detergent and explain what advantages detergents have over soaps.
	[4 marks]
Two biodi	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel.
biodi	biofuels that are used around the world are ethanol, as an additive to petrol, and
biodi	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel.
biodi	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel.
biodi (a)	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel. Write the equation for the production of ethanol from ethene.
biodi (a)	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel. Write the equation for the production of ethanol from ethene. [3 marks]
biodi (a)	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel. Write the equation for the production of ethanol from ethene. [3 marks]
Two biodi (a) (b)	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel. Write the equation for the production of ethanol from ethene. [3 marks] Write an equation for the production of a biodiesel from a fat or oil (tristearate).
(a) (b)	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel. Write the equation for the production of ethanol from ethene. [3 marks] Write an equation for the production of a biodiesel from a fat or oil (tristearate).
biodi (a)	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel. Write the equation for the production of ethanol from ethene. [3 marks] Write an equation for the production of a biodiesel from a fat or oil (tristearate).
(b)	biofuels that are used around the world are ethanol, as an additive to petrol, and esel as a replacement for "standard" diesel. Write the equation for the production of ethanol from ethene. [3 marks] Write an equation for the production of a biodiesel from a fat or oil (tristearate).

(e) Name two types of catalyst that are used in the production of biodiesel. [2 mark Ammonia can be produced by the Haber Process. (a) Write the equation for production of ammonia by this process. [2 mark (b) This process should be carried out at a high pressure. Explain why. [2 mark (c) Predict the effect an increase of temperature would have on the equilibrium yield of ammonia.	(d)	motor vehicle?	in their
(e) Name two types of catalyst that are used in the production of biodiesel. [2 mark Ammonia can be produced by the Haber Process. (a) Write the equation for production of ammonia by this process. [2 mark (b) This process should be carried out at a high pressure. Explain why. [2 mark (c) Predict the effect an increase of temperature would have on the equilibrium yield of ammonia. [2 mark (d) At what temperature is the Haber Process carried out. Justify the use of this			
Ammonia can be produced by the Haber Process. (a) Write the equation for production of ammonia by this process. [2 marks of this process should be carried out at a high pressure. Explain why. [2 marks of the effect an increase of temperature would have on the equilibrium yield of ammonia. [2 marks of the effect and increase of temperature would have on the equilibrium yield of ammonia.	(e)	Name two types of catalyst that are used in the production of biodies	[2 marks] sel.
(a) Write the equation for production of ammonia by this process. [2 mark (b) This process should be carried out at a high pressure. Explain why. [2 mark (c) Predict the effect an increase of temperature would have on the equilibrium yield of ammonia. [2 mark (d) At what temperature is the Haber Process carried out. Justify the use of this			[2 marks]
[2 mark (b) This process should be carried out at a high pressure. Explain why. [2 mark (c) Predict the effect an increase of temperature would have on the equilibrium yield of ammonia. [2 mark (d) At what temperature is the Haber Process carried out. Justify the use of this	Amm	nonia can be produced by the Haber Process.	
(b) This process should be carried out at a high pressure. Explain why. [2 mark] (c) Predict the effect an increase of temperature would have on the equilibrium yield of ammonia. [2 mark] [2 mark] [3 mark] [4 mark]	(a)	Write the equation for production of ammonia by this process.	
(c) Predict the effect an increase of temperature would have on the equilibrium yield of ammonia. [2 mark] (d) At what temperature is the Haber Process carried out. Justify the use of this	(b)	This process should be carried out at a high pressure. Explain why.	[2 marks]

impurities dioxide, su The second CH In the third pressure ov CO f a 1 tonne	h-West Shelf in Western Australia has large reserves of natural gas. The majnt of natural gas is methane, which is used, primarily as fuel for heating and the of electricity. One possible use of methane is to convert it to methanol the used as a petrol substitute.
CH in the third pressure ov CO f a 1 tonne	stage in the conversion of the methane in natural gas to methanol is to remo from the natural gas. These impurities often include ethane, propane, carbo ulfur compounds, nitrogen and water.
In the third pressure ov CO If a 1 tonne	d stage in the production of methanol is to react methane with steam
CO f a 1 tonne	$H_4(g) + H_2O(g) \rightarrow CO(g) + 3 H_2(g)$
f a 1 tonne	ed stage, carbon monoxide and hydrogen are mixed at high temperature ar ver an iron catalyst.
	$O(g) + 2 H_2(g) \rightarrow CH_3OH(g)$
a) The	e sample of natural gas was 85.0% methane, calculate:
	e mass of hydrogen gas that could be produced from this sample.
	[4 mark
b) The reac	e mass of methanol that could be recovered from the 1 tonne sample if the ction process was 92.5% efficient.

14.

Sea water contains approximately 0.13% magnesium by mass. The magnesium can be extracted from the sea water by the following steps:			
A:	Mg ²⁺ ions are removed from the sea water by precipitation:		
	$Mg^{2+}(aq) + Ca(OH)_2(s) \rightarrow Mg(OH)_2(s) + Ca^{2+}(aq)$		
B:	The magnesium precipitate is then converted to a magnesium chloride solution by the addition of hydrochloric acid.		
	$Mg(OH)_2(s) + 2 H^+(aq) + 2 Cl^-(aq) \rightarrow Mg^{2+}(aq) + 2 Cl^-(aq) + 2 H_2O(l)$		
C:	The magnesium chloride is crystallised from solution and heated to form magnesium oxide		
	$MgCl_2.6H_2O(s) \rightarrow MgO(s) + 2 HCl(g) + 5 H_2O(g)$		
D:	Molten magnesium oxide is electrolysed to form pure Mg		
	Anode: $Mg^{2+}(l) + 2 e^{-} \rightarrow Mg(l)$ Cathode: $2 Cl^{-} \rightarrow Cl_{2}(g) + 2 e^{-}$		
(a)	To initiate the extraction process, 1480 kg of calcium hydroxide was added to excess sea water. After a full cycle of the extraction process, 1120 kg of chlorine gas was collected at the cathode. Calculate the efficiency of the extraction process.		
(b)	Given this level of efficiency calculate the mass of sea water required per kilogram of magnesium produced.
