Test 1 2009

50 marks

50 minutes + 2 minutes reading

Name SOLUTIONS

1. [2, 1, 2, 2 marks]

A winery produces a fine liquor which is predicted to increase in value by 4.8% p.a.

(a) How much will a bottle of liquor be worth in 2 years time, if it presently sells for \$45?

$$A = P(1+i)^n$$

$$= 45(1+0.048)^2 = 49.42$$

(b) How much will a bottle of liquor be worth in n years time, if it presently sells for \$45?

$$A = 45(1.048)^n$$

(c) The winemaker plans to release the liquor when it reaches a value of \$100. How long will they have to wait for this to be the case?

$$100 = 45(1.048)^n$$

$$n = 17 \quad \checkmark$$

(d) Another red wine produced by the winery is increasing in value at 2.3% p.a. If a large flagon presently sells for \$74, how long will it be before the Liqueur becomes more expensive than the flagon?

$$45(1.048)^n > 74(1.023)^n$$

$$22 \quad \checkmark$$

Sequence

$$a_{n+1} = a_n \times 1.048 \times 1$$

$$a_0 = 45$$

$$b_{n+1} = b_n \times 1.023 \times 1$$

$$b_0 = 74$$

2. [2, 1, 2, 2 marks]

Given  $p(x) = 5x + 3$  and  $q(x) = 2 - x$ , find the following:

(a) the point of intersection of the two lines,

$$5x - 3 = 2 - x$$

$$6x = 5$$

$$x = \frac{5}{6}$$

$$\frac{20}{\frac{5}{6}} = \frac{20 \times 6}{5} = 24$$

$$\left( \frac{5}{6}, \frac{7}{6} \right) \quad \checkmark$$

(b)  $p(4) = 23$

(c)  $p(q(-1))$

$$q(-1) = 2 - (-1)$$

$$= 3$$

$$p(3) = 5(3) + 3 = 18 \quad \checkmark$$

(d) the value of k for which  $p(k) = -2$ .

$$5k + 3 = -2$$

$$5k = -5$$

$$k = -1$$

3. [1, 1, 3 marks]

A function has a defining rule  $y = 2x^2$

Determine the defining rule for the new function if the graph of this function is

(i) moved 2 units left,

$$y = 2(x+4)^2$$

(ii) reflected in the y-axis,

$$y = 2(-x)^2$$

(iii) reflected in the x-axis, then moved 3 units right and then 1 unit up.

$$y = -2(x-3)^2 + 1$$

4. [4 marks]

A cubic polynomial intersects the x-axis at  $x = -2, 3, 5$ .

Given that the graph goes through the point  $(4, 2)$  find the equation for the polynomial in the form,  $y = ax^3 + bx^2 + cx + d$ .

$$(-2, 0)$$

$$(3, 0)$$

$$(5, 0)$$

$$(4, 2)$$

$$y = -\frac{1}{3}x^3 + 2x^2 + \frac{1}{3}x - 10 \leftarrow \begin{array}{l} \text{starts} \\ \text{cubic eqn} \end{array}$$

At  $(4, 2)$

$$y = a(x+2)(x-3)(x-5)$$
$$2 = a(4+2)(4-3)(4-5)$$
$$2 = a(6)(1)(-1)$$
$$2 = -6a$$
$$a = -\frac{2}{6}$$
$$= -\frac{1}{3}$$

$$y = -\frac{1}{3}(x+2)(x-3)(x-5)$$
$$= -\frac{1}{3}(x^2+x-6)(x-5)$$

5. [6 marks]

With the aid of a graphic calculator produce a sketch of

$$y = x^3 - 3x^2 + 4$$

Indicate any turning points, intercepts with the axes and points of inflection. If any rounding is necessary give answers correct to 2 decimal places.

6. [2, 2, 2, 2, 2 marks]

Match each of the graphs below with its corresponding function.  
Choose from the functions listed below, where a, b, c, d and e are positive integers:

1.  $y = ax - b$  ✓

2.  $y = d^x + 1$

3.  $y = -ax^3 + x^2 + dx$

4.  $y = x^3 - ax - b$

5.  $y = c^x - 1$

6.  $y = \frac{1}{x+c}$

7.  $y = x^2 + x - e$

8.  $y = x^2 - x - d$  ✓

9.  $y = \frac{1}{x-b} + a$

10.  $y + ax = b$

11.  $y = \frac{1}{x-a}$

12.  $y = x + c$

$y = -ax + b$

$y = \frac{1}{x-1} + 1$

$y = (x+1)(x-2)$   
 $= x^2 - x - 2$

7. [2, 3, 3 marks]

State the domain and range for the following functions:

(a)  $\{(2, 3), (1, -9), (0, 4), (-3, 4), (-2, 5), (6, 1)\}$

$$x = \{2, 1, 0, -3, -2, 6\}$$
$$y = \{3, -9, 4, 5, 1\}$$

(b)  $y = x^2 + 4x + 3$

$$x \in \mathbb{R}$$

$$\frac{-b}{2a} = \frac{-4}{2} = -2$$

$$y = 4 - 8 + 3 = -1$$

$$y \geq -1$$

(c)  $y = \frac{1}{2x-3} + 1$

$$x \in \mathbb{R}$$

$$x \neq \frac{3}{2}$$

$$y \in \mathbb{R}, y \neq 1$$

8. [3 marks]

Given the graphs for  $f(x) = ax^3 + bx^2 + cx + d$  and  $g(x) = ex^2 + fx + g$ , for real constants  $a, b, \dots, g$ , solve to 1 decimal place, the equation  $f(x) = g(x)$ .
