A continuous random variable X has the probability function f:

$$f(x) = \begin{cases} 0 & , x < 0 \\ h(10 - x) & , 0 \le x \le 10 \\ 0 & , x > 0 \end{cases}$$

Determine the constant h.

etermine the constant h.

$$\frac{1}{2}(10)(10h) = 1$$
or $\left[10hx - \frac{hx^2}{2}\right]_0^{10} = 1$

$$h = \frac{1}{50}$$

$$h = \frac{1}{50}$$

State the cumulative function F(x) for the PDF f(x).

$$F = \begin{cases} 0, & x < 0 \\ \frac{1}{50}(10x - \frac{x^2}{2}), & 0 < x < 10 \\ 1, & x > 10 \end{cases}$$

Hence or otherwise, determine:

P(X = 3)

d)
$$P(X \ge 1)$$
 $I - F(i)$ $\alpha = \frac{1}{2} \times 9 \times \frac{1}{50} \times 6$

$$= I - 0.19 = \frac{81}{100}$$

$$= 0.81$$

$$= 0.81$$

[2, 3 = 5 marks]

In a certain PDF the distribution is defined by:

$$f(x) = \begin{cases} A\sin(x) & \text{, } 0 \le x \le \pi \\ 0 & \text{, elsewhere} \end{cases}$$

Show that the value of $A = \frac{1}{2}$.

$$\int_{0}^{\pi} A \sin(x) dx = \left[-A \cos(x) \right]_{0}^{\pi} = 1$$

$$= 7 - A \left(\cos(\pi) - \cos(0) \right) = 1$$

$$= 7 2A = 1$$

$$A = \frac{1}{7}$$

$$\int_{0}^{9u} \frac{1}{2} \sin(x) dx = -\frac{1}{2} \left(\cos(\frac{n}{4}) - \cos(0) \right)$$

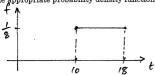

$$= -\frac{1}{2} \left(\frac{5}{2} - 1 \right)$$

$$= \frac{2 - 52}{4}$$

2. [2, 2, 1, 1, 1, 2, 1 = 10 marks]

Mandy catches the bus to and from school each day. It can be assumed that the length of time, T, to wait for the bus between home and school follows a uniform distribution and takes between 10 and 18 minutes.

Make a quick sketch of the appropriate probability density function.

State the probability density function for T.

$$f(t) = \begin{cases} \frac{1}{8}, & w \leq t \leq 18 \\ 0, & elsewhere \end{cases}$$

For a randomly chosen waiting time between home and school, calculate the probability that the time taken by Mandy waits:

more than 16 minutes
$$\frac{2}{8} = \frac{1}{4}$$
less than 13 minutes

more than 15 minutes given that she waits more than 12 minutes.

P(x>15/x>12) =
$$\frac{P(x>15)}{P(x>12)}$$

= $\frac{3}{8}/\frac{1}{8}$ = $\frac{1}{2}$

What was the average time that Mandy waits for the bus

Pierre spends X hours gaming during the day.

The probability distribution of X is given by:

$$f(x) = \begin{cases} 2(1-x) & \text{, } 0 \le x \le 1\\ 0 & \text{, elsewhere} \end{cases}$$

Evaluate E(X), the expected value of X, to the nearest minute.

$$\int_0^1 2x (1-x) dx$$

$$= \frac{1}{3}$$

Determine the variance of X.

$$\int_{0}^{1} 2x^{2}(1-x) dx - \left(\frac{1}{3}\right)^{2}$$

$$= \frac{1}{6} - \frac{1}{9}$$

$$= \frac{1}{18}$$

5. [1, 1, 1, 2, 2, 2, 2 = 11 marks]

Main Roads Western Australia recently installed new radar devices in the Northbridge Tunnel on the Graham Farmer Freeway. During the first week of monitoring the average speed was determined to be 82 km/h with a standard $\times \sim N(82,5.1^2)$

If vehicle speeds can be considered normally distributed, determine the probability that a randomly chosen vehicle was travelling:

(i) less than 80 km/h
$$P(X < 80) = 0.3475$$

(ii) at
$$90 \text{ km/h}$$
 $P(x = 90) = 0$

between 85 km/h and 90 km/h

faster than 90 km/h given the vehicle was travelling in excess of 85

$$P(x>90/x>85) = \frac{P(x>90)}{P(x>85)}$$

$$= \frac{0.0584}{0.2781} = 0.2099$$

The fastest 4% of vehicles were issued with speeding fines b) Above what speed would you calculate a driver to be fined?

Determine the probability that in a randomly chosen group of 12 cars

(1) Exactly three drivers were fined $\gamma \sim b(1)$, 0.04 c)

Exactly three drivers were fined

$$P(Y=3) = 0.0098 (9.75 \times 10^{-3})$$

At least one driver was fined

$$P(y_71) = 0.3873$$

 $\left(1 - 0.96^{12}\right)$

[5 marks]

The speed limit along the Kwinana Freeway is 100 km/h. Speeds are normally distributed with mean μ km/h and standard deviation σ km/h. If it is known that 12.5% of drivers drive in excess of 100km/h and that 5% drive at less than 88km/h, calculate μ and σ to an accuracy of two decimal places.

$$P(x>100) = 0.125$$
 $P(x<88) = 0.05$

ie $\frac{100-\mu}{5} = 1.15$ (1) $\frac{88-\mu}{5} = -1.645$ (2)

Solve simultaneously:

$$\mu = 95.06$$
 $\sigma = 4.29$

6.
$$[2, 2, 1, 1 = 6 \text{ marks}]$$

A continuous random variable X has a mean of 12 and a standard deviation

(i)
$$Y = 5X$$

(ii)
$$Y = 5 - 2X$$

$$E(4) = -2 \times 12 + 5$$

= -19

If $X \sim N(28, 7^2)$ determine the:

$$P(X < k) = 0.31$$

... $K \sim 24.53$

0.73 quantile

$$P(x < k) = 0.73$$

1. $k = 32.29$
