Physics ATAR - Year 11

Thermal Physics Validation Test 2018

Name:			

Mark: / 47 = %

Time Allowed: 50 Minutes

Notes to Students:

- 1. You must include all working to be awarded full marks for a question.
- 2. Marks will be deducted for incorrect or absent units and answers stated to an incorrect number of significant figures.
- 3. **No** graphics calculators are permitted scientific calculators only.

ADDITIONAL FORMULAE AND DATA

• Triple Point of Water = 0.01°C = 273.16 K

$$\bullet \quad \frac{T_{\theta}}{100} = \frac{X_{\theta} - X_0}{X_{100} - X_0} = \frac{R_{\theta} - R_0}{R_{100} - R_0}$$

• K = C + 273.15

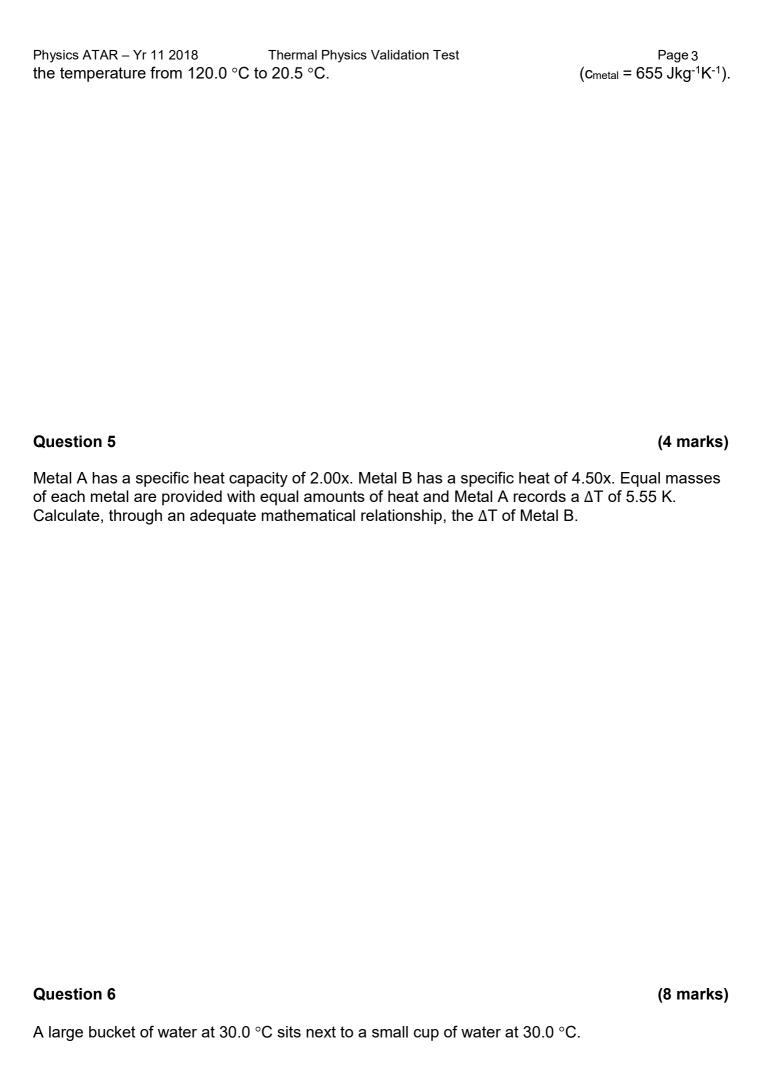

Question 1 (2 marks)

Physics ATAR – Yr 11 2018 Thermal Physics Validation Test Page 2 The Celsius scale was originally calibrated as a centigrade scale with 0 °C for the freezing point of water and 100 °C for the boiling point of water at 1 atm pressure as the fixed points. These were later deemed unreliable and changed to two other fixed points. State these fixed points and explain why they are considered more reliable.
Question 2 (3 marks)
A pan of water is heated from 25.0 °C to 355 K. Calculate the change in temperature in the Kelvin scale.
Question 3 (3 marks)
The electrical resistance an uncalibrated thermostat thermometer is 0.250Ω in ice water and 3.56Ω in boiling water. When placed in a liquid with an unknown temperature the resistance is recorded as 3.99Ω . Calculate the value of the unknown temperature.

Calculate the amount of energy the needs to be removed from a 1.55 kg piece of metal to reduce

Question 4

(3 marks)

Que	stion 7		(4 marks)
			(3 marks
(d)	Explain you	r answer to (c).	(Ol
	(iii)	They both have the same mean speed of particles	
	(ii)	The cup	
	(i)	The bucket	(1 mark
(c)	Choose which has the fastest moving molecules (Circle your chosen answer)		/4
(b)	Explain you	ır answer to (a).	(3 marks
/L\	(iii)	They both have the same amount of internal energy	
	(ii)	The cup	
	(i)	The bucket	
(a)	Choose wh	osen answer) (1 mark	

Calculate the total energy required to vaporise 5.00 x10 2 grams of water initially at 25.0 $^{\circ}$ C.

Question 9

Question 8 (7 marks) A 1.50 x10³ W copper kettle of mass 0.350 kg contains 1.80 kg of water at 25.0 °C. $(c_{Cu} = 390 \text{ Jkg}^{-1}\text{K}^{-1})$ $(c_w = 4180 \text{ Jkg}^{-1}\text{K}^{-1})$ (a) Calculate the amount of energy required to bring the water (and the copper) to its boiling point. (3 marks) (b) Calculate the time, in minutes, required to bring the water to boil (4 marks)

A mass of aluminium at 90.0 °C is immersed in an insulated 0.255 kg volume of water initially at 20.0 °C. The final temperature of the mixture is measured to be 24.4 °C. ($c_{Al} = 900.0 \text{ Jkg}^{-1}\text{K}^{-1}$)

(a) Calculate the mass of aluminium required to produce the final temperature.

(4 marks)

(8 marks)

Question 10

 $(c_{Cu} = 390 \text{ Jkg}^{-1}\text{K}^{-1})$ $(c_w = 4180 \text{ Jkg}^{-1}\text{K}^{-1})$ (5 marks)

(b)	State one assumption made in the above calculation.	(1 mark)
(c)	In reality, state and explain whether the required mass of aluminium would be or no difference to raise the temperature of the mixture to 24.4 °C.	greater, less, (3 marks)

1.40 kg of water is placed in a calorimeter of mass 1.00 kg and specific heat capacity of 655 Jkg⁻¹K⁻¹. Both are cooled to 4.00°C. 0.250 kg of copper at 90.0°C is then placed into the

calorimeter. Calculate the resulting temperature of the mixture.

END OF TEST
