

3.18 - land & sea have very different specific heat capacities

- assuming roughly the same rate of energy transfer in to or out of them, the sea will change temperature more slowly due to its higher specific heat capacity

- the same Q causes a smaller ΔT in water

$$\begin{aligned} 3.19 \quad Q &= 0.145 \times 4180 \times 80 + 0.215 \times 670 \times 80 \\ &= 60012 \text{ J} \\ &= 6.00 \times 10^4 \text{ J} \end{aligned}$$

$$\begin{aligned} 3.20 \quad \text{Heat lost} &= \text{Heat gained} \\ 0.8 \times \cancel{4180} \times 1 &= 0.1 \times 320 \times 87 \\ &? \end{aligned}$$

$$c_{\text{Soup}} = 3480 \text{ J kg}^{-1} \text{ K}^{-1}$$

$$\begin{aligned} 3.21 \quad \text{Heat lost} &= \text{Heat gained} \\ 0.185 \times 4180 \times (85 - T_f) &= 0.035 \times 4180 \times (T_f - 18) \\ 65730.5 - 773.3 T_f &= 146.3 T_f - 2633.4 \\ 68363.9 &= 919.6 T_f \\ T_f &= 74.3^\circ \text{C} \end{aligned}$$

$$\begin{aligned} 3.22 \quad Q &= 0.35 \times 10000 \times 60 \times 60 = 12600000 \text{ J} \\ m &= 1300 \times 60 = 78000 \text{ kg} \\ \Delta T &= \frac{12600000}{78000 \times 4180} \\ &= 0.0386^\circ \text{C} \end{aligned}$$

3.23

$$Q = 0.65 \times E$$

$$0.65E = 5.25 \times 445 \times 84 + 1.55 \times 4180 \times 84$$

$$E = 1139201.538 \text{ J}$$

$$1.14 \times 10^6 \text{ J}$$

$$1.14 \text{ MJ}$$

3.24

$$0.85 \text{ Heat lost} = \text{Heat gained}$$

$$0.85 \times m \times 4180 \times 30.3 = 40 \times 4180 \times 28.5$$

$$m = 44.3 \text{ L}$$

$$m = 44.3 \text{ kg}$$
